Survey on Security Vulnerabilities in Cloud Computing Environment

Sudha Ashok k
Dept. of Information Science, DSCE, India

Abstract: Cloud Computing holds the potential to eliminate the requirements for setting up of high-cost computing infrastructure for IT-based solutions and services that the industry uses. Cloud services are becoming an essential part of many organizations. It promises to provide a flexible IT architecture, accessible through internet from lightweight portable devices. In a cloud computing environment, the entire data resides over a set of networked resources, enabling the data to be accessed through virtual machines. Since these data-center’s may be located in any part of the world beyond the reach and control of users, there are multifarious security and privacy challenges that need to be understood and addressed. Cloud providers have to adhere to security and privacy policies to ensure their users’ data remains confidential and secure. Though there are some ongoing efforts on developing cloud security standards, most cloud providers are implementing a mish-mash of security and privacy controls. This extensive survey paper aims to elaborate and analyze the numerous unresolved issues threatening the cloud computing environment.

Keywords: Cloud Computing, Security, Authentication

I. Introduction

Cloud computing is a fastest growing technology in recent years. One of the most important features of cloud is its elasticity, which allows the user to pay as per their needs. While cloud is beneficial in terms of economy and availability but organizations cannot ignore the security threats to their data on cloud storage. Due to the security issues in cloud many users are reluctant to use it for personal and sensitive data storage. Since cloud storage is third party storage it needs special data security solutions, than traditional third party storages[1].

Internet has been a driving force towards the various technologies that have been developed since its inception. Arguably, one of the most discussed among all of them is Cloud Computing. Over the last few years, cloud computing paradigm has witnessed an enormous shift towards its adoption and it has become a trend in the information technology space as it promises significant cost reductions and new business potential to its users and providers. The advantages of using cloud computing include: i) reduced hardware and maintenance cost, ii) accessibility around the globe, and iii) flexibility and highly automated processes wherein the customer need not worry about mundane concerns like software up-gradation. A plethora of definitions have been given explaining the cloud computing. Cloud computing is defined as a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources that can be rapidly provisioned and released with minimal management effort or service provider interaction. In such an environment users need not own the infrastructure for various computing services. In fact, they can be accessed from any computer in any part of the world. This integrates features supporting high scalability and multi-tenancy, offering enhanced flexibility in comparison to the earlier existing computing methodologies. It can deploy, allocate or reallocate resources dynamically with an ability to continuously monitor their performance [2].

II. Analysis on Issues in Existing Cloud Computing Environment

Acklyn Murray, Geremew Begna, Ebelechukwu Nwafor, Jeremy Blackstone, Wayne Patterson Department of Systems and Computer Science of Howard University proposed “Cloud Service Security & Application Vulnerability” that Cloud computing model offers so many benefits yet it faces issues and criticism due to its non-strict security enforcement. There should be stricter security policies put in place when dealing with cloud applications. Also, applications should enforce more layers of security such as 2 factor authentication to ensure that data is properly secured. Data at rest or in transit should be encrypted and signed to ensure confidentiality, integrity. Also, most business organizations should employ a hybrid cloud model since this ensures that personal information is managed internally on private clouds and not stored on public clouds. This helps to alleviate the risk of personal information being compromised [3].

Previous studies have attempted to determine cloud security issues. Popović et al.’s study on cloud security controls and standards has been focused primarily at the provider end and concentrated on cloud engineering. Subashini and Kavitha present a survey of the different security risks to the cloud [8]. This study is specific to the security issues due to the cloud service delivery models. Kamongi et. al. have also developed a risk model for the cloud but haven’t tied it with existing compliance standards [4].
Identification is a basic and first process of establishing and distinguishing amongst person/user & admin ids, a program/process/another computer ids, and data connections and communications. Often we use alphanumerical string as user identification key and some may use your email as the user identification key and this can be checked against when a user login into the system.

Authentication and authorization are two distinct forms of access controls to access any information in the system. Privacy is the key to maintaining the success of cloud computing and its impact on sharing information for social networking and team work on a specific project. This can be maintained by allowing users to choose when and what they wish to share in addition to allowing encryption and decryption facilities when they need to protect specific information/data/media content.

Integrity is the basic feature of human being as a process of maintaining consistency of actions, communications, values, methods, measures, principles, expectations, and outcomes. Ethical values are important for cloud service providers to protect integrity of cloud user’s data with honesty, truthfulness and accuracy at all time. In cloud computing terms, we can achieve integrity by maintaining regular redundancy checks and digital certification in addition to other basic security features of maintaining identification, authentication, and authorization [5].

Durability is also known as, persistency of user actions and services in use should include sessions and multiple sessions.

Cloud computing model offers so many benefits yet it faces issues and criticism due to its non-stringent security enforcement. There should be stricter security policies put in place when dealing with cloud applications. Also, applications should enforce more layers of security such as 2 factor authentication to ensure that data is properly secured. Data at rest or in transit should be encrypted and signed to ensure confidentiality, integrity. Also, most business organizations should employ a hybrid cloud model since this ensures that personal information is managed internally on private clouds and not stored on public clouds. This helps to alleviate the risk of personal information being compromised [6].

III. Conclusion

Cloud computing, in the recent years, has taken the ability to prove its necessity in terms of data outsourcing. But it also poses a threat to the data owner in terms of privacy and security of data. As Cloud Computing becomes prevalent, more and more sensitive information are being centralized into the cloud, such as e-mails, personal health records, company finance data, and government documents, etc. The fact that data owners and cloud server are no longer in the same trusted domain may put the outsourced unencrypted data at risk. The cloud server may leak data information to unauthorized entities or even be hacked. Although Cloud computing can be seen as a new phenomenon which is set to revolutionize the way we use the Internet, there is much to be cautious about. There are many new technologies emerging at a rapid rate, each with technological advancements and with the potential of making human’s lives easier. However, one must be very careful to understand the security risks and challenges posed in utilizing these technologies. Cloud computing is no exception. This paper helps to identify cloud computing is and what are the challenges and the issues relating to the cloud computing [7].
As part of our ongoing work, we are further analyzing other IT Security Issues in cloud paradigm and determine if they should be incorporated into our cloud security application.
