**Abstract:** Green Information and Communication Technology (ICT) is the study and practice of using computing resources efficiently to achieve economic viability and improved system performance and use while abiding by ethical and social responsibilities. Green ICT frameworks are useful in measuring and evaluating different organizations’ Green ICT efforts. Some frameworks make it easier to interpret and measure green ICT than others, while some do not offer guidance on which metrics to use. Features of Green ICT frameworks have not been studied and documented adequately. Furthermore, existing green ICT frameworks are all static, and have one major limitation, that is the inability to specify realistic components for evaluating the implementation of green ICT. Equipment life cycle, end user computing and enterprise and data center are the main components. The purpose of this study istospecify realistic components for evaluating the implementation of green ICT.A cross sectional study involving 19 ICT directors and 145 ICT technical staff drawn from 19 universities with an established ICT directorate were contacted. Interview schedule and questionnaires were used to collect information on use of ICT equipment and technology. Print media and electronic media were used to collect literature on Green ICT and green ICT frameworks. Questionnaires were used to collect quantitative data while interviews were used to collect qualitative data. Standard statistical software was used to examine any cross-tabulation, associations or groupings which emerged from the quantitative data. Thematic technique was used to categorize and analyze qualitative data. The test re-test method was used to compute reliability coefficient by correlating the results. Validity of the tools used in the research was enforced by the use of multiple sources of data and auditing of the data. The benefits of this research is that it will enable institutions and organizations to measure, evaluate and interpret their Green ICT efforts objectively.

**Keywords:** ICT, Green ICT, Equipment Life Cycle, End User Computing and Enterprise and Data Center.

Date of Submission: 20-04-2018

Date of acceptance: 07-05-2018

I. Introduction

Information and Communication Technology (ICT) can be used in several ways to help address environmental problems we face and to improve environmental sustainability. But ICT can also be a contributor to environmental problems confronting us (Murugesan, 2011). A downside of widespread adoption and use of ICT are the potentially harmful effects it can have on the environment if not managed well (Murugesan, 2011).

Improving environmental performance, tackling global warming and improving resource management are high on the list of global challenges that need addressing urgently. ICT industry needs to further improve its environmental performance for it is responsible for around 2-3% of the global carbon footprint (Organization for Economic Co-operation and Development, 2009).

**Challenges Facing the Implementation of Green ICT**

The enablers and barriers to ICT transformation need to be understood at both micro and macro levels. However, green ICT implementations in various institutions have not been sufficiently analyzed at the micro level of an institution which represents a gap in the current academic literature (Jain, 2011). Green ICT implementations in institutions appear simple in concept but when we approach the details, they can be quite complicated. Hence it is important to focus on studying these implementations at the institutional level (Jain, 2011).

Green ICT initiatives are going beyond simply operational or tactical activities; these green initiatives are becoming part and parcel of business strategies and planning. So, if the green ICT initiative is not integrated
within an institution’s strategies and planning, it will be difficult to implement it (Curtis & Lingarchani, 2011). Agreeing on what the green ICT principals and objectives will be and adhering to the plan of implementing them is another challenge. Also there are challenges especially where this involves changes in behaviors associated with new business processes and associated applications.

Most research shows that there is no official legislation to enforce green ICT practices within institutions, and therefore there is no such practice that has been implemented. We can summarize this section by deducing that some factors why green ICT practices are not implemented are; No official legislation enforcing green ICT practices, no pressure from management/customers and employees lack the appropriate knowledge or training. (Council of European Professional Informatics Societies (CEPIS), 2012). No university in their ICT policy has addressed green ICT framework. Even the Kenyan ICT policy does not address green ICT framework.

II. Research Methodology

Research Design

Singh (2006) describes research design as to include the following components: research methodology or research strategy, sampling design, choice of research tools, and choice of statistical techniques. Scientific studies tend to focus on one or the other of two major activities. The first activity consists of exploratory data collection and analysis, which is aimed at classifying behaviors within a given area of research, identifying potentially important variables, and identifying relationships between those variables and the behaviors. The second activity, called hypothesis testing, consists of evaluating potential explanations for the observed relationships (Bordens & Abbott, 2011). This research focused on the first activity which consists of exploratory data collection and analysis of the implementation of Green ICT in universities in Kenya.

More specifically, the research was administered by the use of questionnaires sent via email as attachments to both ICT directors and ICT technical staff and interview schedule with ICT directors. Denscombe (2007) describes cross sectional study as to relate to the present state of affairs and involves an attempt to provide a snapshot of how things are at a specific time at which the data are collected.

Population and Sample Size

Given the nature of this research purposive sampling was specifically chosen when selecting the ICT directors of universities for a methodology judged by how well it informs research purpose. Simple random sampling means that every element in the population of interest has an equal and independent chance of being chosen. Here the word ‘independent’ means that the selection of any one element in no way influences the selection of any other. ‘Simple’ does not mean that random sampling is easier to carry out than other methods, but that steps are taken to ensure that nothing influences selection each time a choice is made, other than chance (Sapsford & Jupp, 2006). This methodology was applied when selecting the ICT technical staff in each university to participate in this study.

The target population comprised of ICT directors and technical staff members of ICT directorate. There are total of 19 ICT directors and 426 ICT technical staff members from the 19 universities. The total population is 445. Kothari (2004) recommends the use of 30% of the target population. That 30% of the population is enough for a study sample, the study used at least 30% of the target population as this was adequate and representative. This translated to 19 ICT directors and 145 ICT technical staff as the sample size as per the sampling procedure. The total sample size was 164.

Sampling Procedure

The researcher used simple random sampling procedure to sample 30% of the ICT technical staff members of each university. This gave the researcher 164 respondents from the population. All the ICT directors from the nineteen universities were required to participate in this study hence using purposive sampling procedure.

Data Collection Instruments

Dawson (2009) asserts that research instruments are the tools you use to gather data, such as questionnaires or interviews. Three main research instruments will be utilised for primary and secondary data collection. These three are as follows:

Questionnaires

According to Lancaster (2005) questionnaires are among one of the most widely used and valuable means of data collection. Because the data collected was analysed statistically, the questionnaires was tightly structured with both closed and open ended questions.
Interview Schedule

Interviews were conducted specifically with the ICT directors of various universities. This tool was also used to collect information on technological, environmental, economic, corporate social responsibility and government influence factors on the implementation of Green ICT.

Documents Analysis

Documents can be treated as a source of data in their own right though, alternative types of documents for research, take different forms of visual sources (pictures, artefacts) and even sounds (music) and that these constitute some form of ‘document’ which has a value for research (Denscombe, 2007). This tool was used to collect information on Green ICT and Green ICT frameworks.

Data Analysis

A number of ways have been used in this section to present the analyzed data including tables, pie and bar charts among others. Before data analysis, data processing was done so as to correct possible errors such as; eliminating unusable data, interpretation of ambiguous answers and verifying contradictory data from related questions.

Demographic Analysis

ICT directors and ICT technical staff formed the respondents who participated in the study to generate required data.

ICT directors and ICT technical staff Respondents

A total of 155 respondents were involved in this study. Further details of the distribution of the staff involved in this study are shown in Table 1.1. These respondents includes directors and other staff holding positions in the unit within the university charged with the responsibility of providing ICT related services to other units of the university.

These respondents were drawn from across selected universities in Kenya.

Respondent Distribution in Selected Universities

Different universities had different numbers of respondents participating in the study. Table 1.2 shows the particular universities with their corresponding total number of respondents. Different levels of participation were realized. The table provides frequency and crosstabulation of respondents and their distribution across the universities under study.

Respondents were drawn from the nineteen universities as shown in Table 1.2 even though with different numbers.

The data presented in Table 1.2 for the universities distribution was presented in the bar graph shown in Figure 1.1

Overall Gender Composition of the Respondents in the Study

Gender composition of respondents varied across all the universities under study. Further details are reflected in Table 1.3; more male participated in the study at 69% compared to female at 31% indicating a higher number of male than female in ICT, the area under study.

Table 1.3: Overall Gender Distribution of Respondents in the Study

<td></td>
</tr>
</tbody>
</table>

Table 1.3 indicated that the field of ICT is currently male dominated given the larger number of male participants in the study across all the universities compared to female participants. Whereas gender disparity of respondents may not have a consequence on the implementation of Green ICT technical aspects sought in the study, recognition of gender distribution across the universities under study is significant.

The data presented in Table 1.3 for the gender distribution was presented in the pie-chart shown in Figure 1.2;
Components for Evaluating the Implementation of Green ICT

There is an oversimplification of components being used in green ICT frameworks making them more subjective rather than objective, as a result the frameworks become rigid in evaluating the implementation of green ICT. This rigidity is addressed by the dynamic framework by illustrating on the following components; equipment life cycle, end user computing and enterprise and data center.

This study sought to specify realistic components for evaluating the implementation of green ICT. To achieve this, relevant data was analyzed accordingly to cover the following aspects among others from the stakeholders; equipment life cycle, end user computing and enterprise and data center.

The ICT equipment suppliers reclaiming and recycling the old ICT equipment

Data was collected in the study on ICT equipment suppliers reclaiming and recycling the old ICT equipment and presented as shown in Table 1.4.

Table 1.4: Responses on ICT equipment suppliers reclaiming and recycling the old ICT equipment

### III. Conclusion

Equipment life cycle, end user computing and enterprise and data center stands out as the main components to be considered in the implementation of green ICT. The various activities discussed above clearly indicate how crucial these activities are in the implementation of green ICT. Green ICT frameworks will be useful in measuring and evaluating different organizations’ green ICT effort if they address these components.
