**Abstract:** The genus *Manniophyton Fulvum* belongs to the family Euphorbiaceae, which is geographically distributed widely in tropical Africa. It has been investigated for a number of properties, such as analgesia, anti-inflammation and as remedy for cough, dysentery, haemorrhoids and haemoptysis.

**Aims:** This study investigates the phytochemical composition and antidiarrheal properties of the plant.

**Methodology:** Aqueous and ethanol leaves extracts of *Manniophyton fulvum* was prepared and used for the experiment. During the entire period of study the animals were supplied with standard pellet diet and water ad libitum. The animal experimentation was carried out accordance to the guidelines of Institutional Animal Ethics Committee (IAEC).

**Results:** Phytochemical studies carried out on aqueous and ethanol extract of *Manniophyton fulvum* leaves showed the presence of alkaloid, saponin, phenol, tannin, flavonoid, cardiac glycoside, steroid, phytosterol, triterpenoid and phlobatannin. The aqueous and ethanol leaves extracts of *Manniophyton fulvum* showed significant \((p<0.05)\) antidiarrheal activity on gastrointestinal motility with barium sulfate milk and castor oil-induced diarrheal model in rats.

**Conclusion:** These result obtained in this study, suggest that the leaves extract possess pharmacological activity against diarrhea and may find a place in the management of illness that present with diarrhea.

**Keywords:** Antidiarrheal activity, Barium sulfate milk, Castor oil, *Manniophyton fulvum*, Phytochemistry.

---

### I. Introduction

Disease conditions that has diarrheal presenting as one of the symptoms are one of the leading causes of morbidity and mortality in developing countries especially amongst children and are responsible for the death of millions of people each year. \((1)\). Despite immense technological advancement in modern medicine, many people in the developing countries still rely on medicinal plants for their daily health care needs \((2)\). Therefore, the World Health Organization encouraged studies leading to the treatment and prevention of diarrheal diseases using herbs. \((3)\).

*Manniophyton fulvum* belongs to the family Euphorbiaceae, made up of shrubs or climber of about 30m. The flowers are usually pale to yellow in colour, and the genus is made up of approximately 20 species. *Manniophyton Fulvum* is a widely used locally in Nigeria for both therapeutic and nutritional purposes. It grows in a range of ecological zones in Africa and produces large mass forage and is drought tolerant. \((4)\). The macerated leaves of the plants are consumed as vegetables and condiments while the water extract serves as tonic for the prevention of certain illnesses. \((5)\).

*Manniophyton fulvum* has been studied and found to possess several therapeutic properties, like antiviral, antioxidant, antibiotic, wound healing and anti-inflammatory activity \((5)\). This study was carried out to investigate *Manniophyton fulvum* for diarrheal properties following its use in the management of diarrheal amongst the Urhobos, Isokos and Beni people of Delta and Edo states, Niger Delta, Nigerian folklore medicine using various models.

### II. Materials and Methods

**2.1 Plant Material**

*Manniophyton fulvum* leaves were collected from the wide growing habitat in Ethiope West Delta State, Nigeria. The leaves were removed from the stalk and air dried at room temperature \((22\pm2^\circ\text{C})\), to a constant weight after which it was grounded with sterilized machine and sieved to fine powder and made into extracts used for the experiment, \((6)\).
2.2 Preparation of the Extracts

The powder was weighed (600g). The powder was divided into two equal part and soaked in 1500ml distilled water and 1500ml of ethanol respectively, for 72hrs. The extract was obtained using an electrical evaporator extraction apparatus (rotary evaporator). The solvent was extracted at a temperature of 45°C and pressure of 60cm of water. Paste-like extract was obtained and oven dried to complete solid and grinded to smooth powdered form, (6).

2.3 Qualitative Phytochemical Analysis

The powdered material and extract of the plants were subjected to different kinds of chemical tests to investigate the presence of secondary metabolites such as saponins, tannins, flavonoids, phenol, anthraquinones cyanogenic glycosides, cardiac glycosides and alkaloids using standard procedures (7,8,9,10,11).

2.4 Test for Proteins
2.4.1 Millon’s test

Crude extract when mixed with 2ml of Millon’s reagent, white precipitate appeared which turned red upon gentle heating that confirmed the presence of protein.

2.5 Test for Carbohydrates
2.5.1 Fehling’s test

Equal volume of Fehling A and Fehling B reagents were mixed together and 2ml of it was added to crude extract and gently boiled. A brick red precipitate appeared at the bottom of the test tube indicated the presence of reducing sugars.

2.6 Iodine Test

Crude extract was mixed with 2ml of iodine solution. A dark blue or purple coloration indicated the presence of the carbohydrate.

2.7 Test for Phenols and Tannins

Crude extract was mixed with 2ml of 2% solution of FeCl3. A blue-green or black coloration indicated the presence of phenols and tannins.

2.8 Test for Flavonoids
2.8.1 Shinoda test

Crude extract was mixed with few fragments of magnesium ribbon and concentrated HCl was added drop wise. Pink scarlet colour appeared after few minutes which indicated the presence of flavonoids.

2.9 Alkaline Reagent Test
2.9.1 Test for phytosterol

The extract was refluxed with solution of alcoholic potassium hydroxide till complete saponification takes place. The mixture was diluted and extracted with ether. The ether layer was evaporated and the residue was tested for the presence of phytosterol. The residue was dissolved in few drops of diluted acetic acid; 3 ml of acetic anhydride was added followed by few drops of Concentrated H2SO4. Appearance of bluish green colour showed the presence of phytosterol.

2.9.2 Test for triterpenoids

10mg of the extract was dissolved in 1 ml of chloroform, 1 ml of acetic anhydride was added followed by addition of 2 ml of Concentrated H2SO4. Formation of reddish violet colour indicates the presence of triterpenoids.

2.9.3 Test for phlobatannins

About 2 ml of aqueous extract was added to 2 ml of 1% HCl and the mixture was boiled. Deposition of a red precipitate was taken as an evidence for the presence of phlobatannins.

2.9.4 Test for saponins

Crude extract was mixed with 5ml of distilled water in a test tube and it was shaken vigorously. The formation of stable foam was taken as an indication for the presence of saponins.
2.9.5 Test for glycosides
Liebermann’s test: Crude extract was mixed with each of 2ml of chloroform and 2ml of acetic acid. The mixture was cooled in ice. Carefully concentrated H2SO4 was added. A colour change from violet to blue to green indicated the presence of steroidal nucleus, that is, glycone portion of glycoside.

2.9.6 Keller-kilani test
Crude extract was mixed with 2ml of glacial acetic acid containing 1-2 drops of 2% solution of FeCl3. The mixture was then poured into another test tube containing 2ml of concentrated H2SO4. A brown ring at the interphase indicated the presence of cardiac glycosides.

2.9.7 Test for steroid
Crude extract was mixed with 2ml of chloroform and concentrated H2SO4 was added sidewise. A red colour produced in the lower chloroform layer indicated the presence of steroids. Another test was performed by mixing crude extract with 2ml of chloroform. Then 2ml of each of concentrated H2SO4 and acetic acid were poured into the mixture. The development of a greenish coloration indicated the presence of steroids.

2.9.8 Test for terpenoids
Crude extract was dissolved in 2ml of chloroform and evaporated to dryness. To this, 2ml of concentrated H2SO4 was added and heated for about 2 minutes. A grayish colour indicated the presence of terpenoids.

2.9.9 Test for alkaloids
Crude extract was mixed with 2ml of 1% HCl and heated gently. Mayer’s and Wagner’s reagents were then added to the mixture. Turbidity of the resulting precipitate was taken as evidence for the presence of alkaloids.

2.10 Quantitative Determination of the Chemical Constituent
2.10.1 Preparation of fat free sample
2 g of the sample were defatted with 100 ml of diethyl ether using a soxhlet apparatus for 2 hours.

2.10.2 Determination of total phenols by spectrophotometric method
The fat free sample was boiled with 50 ml of ether for the extraction of the phenolic component for 15 min. 5 ml of the extract was pipetted into a 50 ml flask, then 10 ml of distilled water was added. 2 ml of ammonium hydroxide solution and 5 ml of concentrated amylalcohol were also added. The samples were made up to mark and left to react for 30 min for colour development. This was measured at 505 nm.

2.10.3 Alkaloid determination using Harborne (1973) method
5 g of the sample was weighed into a 250ml beaker and 200 ml of 10% acetic acid in ethanol was added and covered and allowed to stand for 4 hours. This was filtered and the extract was concentrated on a water bath to one-quarter of the original volume. Concentrated ammonium hydroxide was added drop wise to the extract until the precipitation was complete. The whole solution was allowed to settle and the precipitated was collected and washed with dilute ammonium hydroxide and then filtered. The residue is the alkaloid, which was dried and weighed.

2.10.4 Tannin determination by Van-Burden and Robinson (1981) method
500 mg of the sample was weighed into a 50 ml plastic bottle. 50 ml of distilled water was added and shaken for 1 hour in a mechanical shaker. This was filtered into a 50 ml volumetric flask and made up to the mark. Then 5 ml of the filtered was pipetted out into a test tube and mixed with 2 ml of 0.1 M FeCl in 0.1 M HCl and 0.008 M potassium ferrocyanide. The absorbance was measured at 120 nm within 10 min.

2.10.5 Saponin determination
The samples were ground and 20 g of each were put into a conical aqueous and ethanol. The samples were heated over a hot water bath for 4 h with continuous stirring at about 5 another 200 ml 20% ethanol. The combined extracts were red at about 90ºC. The concentrate was transferred into a 250 ml separatory funnel and 20 ml of diethyl ether was added and shaken vigorously. The aqueous layer was recovered while the ether layer was discarded. The purification process was repeated. 60 ml of washed twice with 10 ml of 5% aqueous sodium chloride. The remaining solution was heated in a waterbath. After evaporation the samples were dried in the oven to a cons weight; the saponin content was calculated as percentage.
2.10.6 Flavonoid determination by the method of Bohm and KocipaiAbyazan (1974)

10 g of the plant sample was extracted room temperature. The whole solution was filtered through Whatman filter mm). The filtrate was later transferred into a water bath and weighed to a constant weight.

2.11 Animals and diet

Male albino rats obtained from the animal house of Emma-maria Biomedic Laboratories & Consultancy, Abraka, weighing between 120-150 g was used for the study. The rats were housed in a well-ventilated animal unit provided by the Department of Pharmacology, Delta State University, Abraka, (21 ± 2°C; relative humidity 60-70 %, 12hr light/ dark cycle). The rats were fed standard grower mash diet mixed with charcoal in a ratio of 2 :1 (Composition of the grower’s mash: Protein -19.0% Fat -2.85% Fibre -6.00% Calcium -1.00% Available phosphate -0.45% Energy -2875 KGC purchased from Animal Care Services Konsult NIG. LTD, Asaba, Delta State and water ad libitum. Permission for the use of animals and animal protocol was obtained from the Research ethics committee of Delta State University, Abraka and the laboratory animal ethics guideline was followed (6).

2.12 Gastrointestinal motility test with barium sulfate milk

The experiment was carried out by the method described by Chatterjee (14). Over night fasted twenty wistar albino rats were randomly divided in to four equal groups (n=5). All the animals in each group was given 2ml of 10% barium sulfate solution and 30mins after, the negative Control group was given only distilled water 2 mL/rat orally. Positive control group received commercially available anti diarrheal drug loperamide 1mg/kg orally while the treatment groups received Manniophyton fulvum leaves aqueous and ethanol extracts 400 mg/kg orally. At the expiration of another 30mins, all the rats were sacrificed by cervical dislocation, the abdomen opened and the total length of the small intestine measured with a calibrated ruler. The distance travelled by the charcoal stained meal (chyme) from the pylorus to caecum was determined and expressed as a percentage of the total length of the small intestine. Also the percent inhibition of movement was calculated for both the positive control and the treatment groups.

2.13 Castor oil-induced diarrhea

Castor oil-induced diarrhea model was carried out using the method described by Shoba and Thomas (15), twenty Wistar albino rats were randomly divided in to four equal group (n=5). Negative control group, positive control group and treatment group respectively. The negative control group received only distilled water 2 mL/rat, Positive control group received loperamide 1 mg/kg as standard while the treatment groups received Manniophyton fulvum leaves extracts at the dose 400 mg/kg body weight aqueous and ethanol extract. The rats was housed in separate cages having paper placed below for collection of fecal matters. Diarrhea was induced in rats by oral administration of castor oil (1.0 ml/rat). Extracts and drugs were given orally 1 hour before the administration of standard dose of 1.0 ml of castor oil.

The number of both hard and soft pellet was counted at every hour over 6 hour period for each rat. Diarrhea was defined as the presence in the stool with fluid material that stained the paper placed beneath the cages. Percent inhibition (PI) was calculated as follows:

\[
PI = \frac{\text{Mean defecation (Control group} - \text{Treated group}) \times 100}{\text{Mean defecation of control group}}
\]

2.15 Statistical analysis

The result of this study were expressed as mean + SEM, and were analyzed by one way analyses of variance (ANOVA) using statistical package for social science (SPSS, 20). Difference between the means were tested with post Hoc- LSD test for multiple comparison and significance was considered when p< 0.01. Student’s dependent t-test was used to analyze the significant difference between the groups.

Phytochemical analysis conducted on the *Manniophyton fulvum* extracts revealed the presence of constituents which are known to exhibit medicinal as well as physiological activities similar to the study done by Aiyegboso and Okoh (16). Analysis of the plant extracts revealed the presence of phytochemicals such as phenols, tannins, flavonoids, saponins, glycosides, steroids, terpenoids, and alkaloids (Tables 1 and 2).

The phenolic compounds are one of the largest and most ubiquitous groups of plant metabolites (17). They possess biological properties such as anti-apoptosis, anti-aging, anticarcinogen, anti-inflammation, anti-atherosclerosis, cardiovascular protection and improvement of endothelial function, as well as inhibition of angiogenesis and cell proliferation activities (18). Several studies have described the antioxidant properties of medicinal plants which are rich in phenolic compounds (19). Natural antioxidant mainly comes from plants in the form of phenolic compounds such as flavonoid, phenolic acids, tocopherols etc. (20). Tannins bind to proline rich protein and interfere with protein synthesis. Flavonoids are hydroxylated phenolic substances known to be synthesized by plants in response to microbial infection and they have been found to be antimicrobial substances against wide array of microorganisms in vitro (18). Their activity is probably due to their ability to complex with extracellular and soluble proteins and to complex with bacterial cell wall, (21).

Triterpenoids are terpenoid derivatives of triterpene molecules. They may have useful anticancer properties, (23). They also are effective antioxidant and show strong anti- cancer activities (23).

The plant extracts were also revealed to contain saponins which are known to produce inhibitory effect on (22). The results obtained in this study thus suggest the identified phytochemical compounds may be the bioactive constituents and this plant is proving to be an increasingly valuable reservoir of bioactive compounds of substantial medicinal merit.

*Manniophyton fulvum* Leaves extracts significantly (p<0.05) decreased the distance of gastrointestinal motility of rats from 100% (negative control group) to 59.74% (aqueous) and 27.39% (ethanol), respectively (treatment groups). While loperamide (1mg/kg), exhibited marked reduction, 32.20% with barium sulfate milk at 30 min study (Table 1). *Manniophyton fulvum* leaves extract significantly (p<0.01) inhibited the mean number of defecation when compared to negative control group (84.61%) and treatment group 1 (66.10%) and treatment group 2 (47.06%) inhibition of the severity of diarrhea induced by castor oil was observed. The number of stools at 2 hours for ethanol extract treated group was significantly (p<0.05) decreased as compared to control group. The percent inhibition of defecation of *Manniophyton fulvum* leaves ethanol extract (47.06%) was found comparable to the effect of standard anti diarrheal drug loperamide (20.20%) (Table II).

KEY: ALEMF = AQUEOUS LEAVES EXTRACT OF Manniophyton fulvum
ELEMF = ETHANOL LEAVES EXTRACT OF Manniophyton fulvum

The leaves extracts showed a significant (p<0.05) activity against castor oil-induced diarrhea. The result is comparable to the effect of widely used anti-diarrheal drug loperamide when tested at 1 mg/kg. Castor oil is made up of 90% ricinoleic (31) which is metabolized to ricinoleic acid. Ricinoleic acid causes the irritation and inflammation in the intestinal mucosa, leading to release of prostaglandins, which stimulate the net secretion of water and electrolytes into the small intestine (32). We speculate that the anti-diarrheal effects of leaves extracts may be due to the inhibition of prostaglandin biosynthesis. Manniophyton fulvum leaves extract also significantly (p<0.05) decreased the distance of gastrointestinal motility of rats.

IV. Conclusion

The result of this study reveals that the leaves extract of Manniophyton fulvum contains pharmacologically active substances with anti-diarrheal properties. These properties could be a potential source of modern pharmaceutical products. Further investigation is necessary to isolate, identify and characterize the different active compounds found in the extract and to elucidate their mode of action.

ETHICAL APPROVAL

All authors hereby declare that all experiments have been examined and approved by the appropriate ethics committee and have therefore been performed in accordance with the ethical standards laid down in the 1964 declaration of Helsinki.
