#### Abstract

Flower cultivation has emerged as a lucrative business which ensures higher economic returns as compared to other agricultural crops. The main purpose of the study is to evaluate the costs, returns and profitability of growing flowers. The study also attempts to examine the profitability of some selected flowers in comparison with their competing crops. In order to study weather floriculture is a profitable venture or not, we are required to study the costs and returns of floriculture. The study results were highly encouraging with the respect to higher economic returns of floriculture in the different physiographic divisions of study area. It was observed that the profitability of valley floor is maximum as compared to other two divisions of study area. From the study it was observed that the profitability of floriculture is more as compared to other forms of farming.

Keywords: Floriculture, Agriculture, Valley, profitability and farming.
Date of Submission: 17-08-2017 Date of acceptance: 10-10-2017

## I. INTRODUCTION

Floriculture is defined as "a discipline of horticulture concerned with the cultivation of flowering and ornamental plants for gardens and for floristry, comprising the floral industry" (Getu, 2009).Floriculture has become one of the important high-value agricultural industries in many countries of the world. International trade in cut-flowers is growing at a rate of 25 per cent annual growth rate. The global exports increased over 10 -folds from 0.5 billion in 1995 to 5.1 billion to 2005, which again is poised to double by 2025 (Usman,2015). Floriculture in India is being viewed as an elevated growth industry.As per National Horticulture Data base published by National Horticulture Board, during 2014-2015 the area under Floriculture production in India was 248.51 thousand hectares with a production of 1,685 thousand tones loose flowers and 472 thousand tones cut flowers. The transformation of the floriculture from being merely domestic to global has opened opportunities for multinational collaborations in the developing countries of the third world (Dadlani, 2003). Floriculture has emerged as an economically viable diversification option in the Kashmiri agribusiness and has captured the interests of many new entrepreneurs into agricultural sector in the recent times (Directorate of Economic Survey-2012-2013, J\&K).This is an emerging economic field and has been in the forefront in the recent years. The high-tech floriculturists grow flowers under controlled conditions mainly to cater to the demands of the fast expanding international market. Floricultural products constitute a small but important segment of the international trade. These are high value products that are used for their beauty and elegance and they reap very high economic returns when compared to other agricultural and horticultural products.

## II. STUDY AREA

The Srinagar city along with its Rural - Urban Fringe is selected for the present study. The study area is located between the co-ordinates $33^{\circ} 53^{\prime} 49^{\prime \prime} \mathrm{N}$ to $34^{\circ} 17^{\prime} 14^{\prime \prime} \mathrm{N}$ Latitude and $74^{\circ} 36^{\prime} 16^{\prime \prime} \mathrm{E}$ to $75^{\circ} 01^{\prime} 26^{\prime \prime} \mathrm{E}$ Longitude. It is situated at an altitude of 5200 feet above mean sea level. The Greater Srinagar covers an area of 1068.72 sq. kms with a population of 931282 (Census of India, 2011).

Fig: 1 Location Map of Study Area with Physiographic Regions and Sample Sites

OBJECTIVES
To analyze the cost-benefit scenario on the economic viability of floriculture in Greater Srinagar.

## III. MATERIALS AND METHODS

On the basis of altitude of the study area is divided into three physiographicdivisionsi.e Valley floor, Karawas and Foot hill with valley floor occupying an area of $598.61 \mathrm{sq} . \mathrm{kms}$ and accounts 56 percent of total geographic area of Greater Srinagar and the foot hill and karewas comprising an area of $278.58 \mathrm{sq} . \mathrm{kms}$ and 192.49 sq. kms accounts 26 percent and 18 per cent of total area respectively.Lists of registered flower growers were taken from the directorate of Floriculture. Total number of registered growers in the study area were 192 and 62 ( 32 Per cent) growers were selected in all, out of which 38 growers were from the valley floor, 14 growers were from foot hills and 10 were from karewas through purposive sampling method for in-depth study. The data were collected from the private flower nursery owners and in every site two households were selected. In the study area, The Primary data was collected from the floriculturists in the study area through combination of structured and non-structured questionnaires. The information was collected regarding economic viability of floriculture. Then the collected set of information was classified, tabulated and statistically evaluated. The information which was collected during the field survey was in unit of Kanals which is not a standard scale. The unit areas (Cost on planting material, labor cost etc.) were converted into per Hectare.In order to find out the profitability of floriculture the cost-benefit analysis method was adopted and four flowers were selected(Rose, Marigold, Gladiolus and Lillium), and the cost was divided into fixed and variable cost. In order to see whether floriculture is economically viable as compared to other farms of farming, the secondary data from the Economic Survey 2013-14 was used. The yield per hectare per year of various crop in Kashmir were analyzed and after that the profitability of these crops were find out and were compared with the profitability of the selected flowers in the study area.

## IV. RESULTS AND DISCUSSIONS

The information on cost and return were collected from the sample population. For the Cost-benefit analysis only four flowers were selected. The cost benefit analysis of floriculture was done in order to work out the overall scenario of the economic viability of floriculture. The cost referred were worked out by assessing
total cost on labor, planting material, plant protection material etc. similarly the output referred includes spikes, seeds bulbs, oil etc., were converted into monetary terms to evaluate the economic efficiency of floriculture in different physiographic regions

TABLE 1 CULTIVATION COST OF FLORICULTURE IN DIFFERENT PHYSIOGRAPHIC DIVISIONS IN GREATER SRINAGAR (PER HECTARE/YEAR IN RS)

|  | Types of Flowers | Fixed Cost | Variable Cost |  |  |  | Total cost(Fixed + Variable cost) (Rs) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Source:Field survey (2013-14)
The Table 1clearly shows that the cultivation cost of various flowers among the three physiographicregions of the Greater Srinagar. Among these cultivations costs the planting material cost is maximum and the miscellaneous cost includes the transport charges, packing charges is minimum in the Greater Srinagar.

TABLE 2 TOTAL COST, GROSS RETURN AND PROFITABILITY OF FLORICULTURE IN DIFFERENT PHYSIOGRAPHIC DIVISIONS IN GREATER SRINAGAR (PER HECTARE/YEAR IN RS)

|  | Flowers | Total Cost/hect./year (Rs) | Gross <br> Return/hect./year <br> (Rs) | Profitability/hect./year (Rs) |
| :---: | :---: | :---: | :---: | :---: |
| $\bar{\pi} \text { 흘 }$ | Rose | 452640 | 960960 | 508320 |

|  | Marigold | 318580 | 638820 | 320240 |
| :---: | :---: | :---: | :---: | :---: |
|  | Gladiolus | 523540 | 854200 | 330660 |
|  | Lillium | 520640 | 765620 | 244980 |
|  | Rose | 234600 | 622720 | 388120 |
|  | Marigold | 160700 | 472000 | 311300 |
|  | Gladiolus | 243140 | 440000 | 196860 |
|  | Lillium | 217660 | 400000 | 182340 |

Source:Field Survey (2013-14)
In the Table 1.2 total cost, gross returns and profitability were analyzed. The total cost among the three regionsis highest in valley floor and the productivity of the various flowers is also highest in this division. Analization of profitability of floriculture gives the contrasting figures different flowers have shown varying profitability trends during the period of study. In foot hills highest profit is shown by the flower gladiolus and lillium and the marigold shows the least profit. In valley floor the highest profit is shown by the flower rose and least by marigold. In karewas again the rose flower shows the maximum profit and least is shown by the lillium flowers.

FIG 2 PROFITABILITY OF FLORICULTURE IN DIFFERENT PHYSIOGRAPHIC DIVISIONS OF GREATER SRINAGAR PER HECTARE/YEAR INR.

[^0]The profitability per hectare of the various crops in the Kashmir Valley is compared with the profitability of the flowers in the study area. Profitability per hectare of flowers ranges high as has revealed from the present study. However if appropriate measures are taken for its growth and development, the industry can flourish well and can prove a prospective industry in future.

TABLE 3 YIELD PROFITABILITY PER HECTARE PER YEAR (INR) OF VARIOUS CROPS IN KASHMIR.

| S.No. | Various Crops | Yield (Qt/Ha/ year) | Profitability/ hect./ year <br> (Rs) |
| :---: | :---: | :---: | :---: |
| 1 | Rice | 34 | 81600 |
| 2 | Maize | 12 | 18000 |
| 3 | Pulses | 10 | 10000 |

Source: Economic Survey (2013-14).
TABLE 4 PROFITABILITY PER HECTARE PER YEAR (RS) OF THE FLOWERS IN THE STUDY AREA.

| S.No | Flowers | Profitability/ hect./ year (Rs) |  |  |
| :--- | :--- | :---: | :---: | :---: |
|  |  | Valley floor | Karewas | Foot hill |
| 1 | Rose | 508320 | 388120 | 185000 |
| 2 | Marigold | 320240 | 311300 | 170000 |
| 3 |  |  |  |  |
| 4 | Gladiolus | 330660 | 196860 | 375991 |

Source: Field Survey (2013-14).
From the Table 3 and 4 the conclusion that the floriculture is more economically viable activity as compared to other farms of farming. The profitability per hectare per year of the floriculture crop is more as compared to other farms of farming.

## V. CONCLUSION

During the past few years growth of floriculture in this region has assumed national importance in terms of increase in production and varietyand has become highly specialized and intensive form of agriculture in Kashmir region. Floral business is in progress though on limited scale but growing demand of flowers has resulted in need to explore potential for expansion of this business. The study results were highly encouraging with the respect to higher economic returns of floriculture in the different physiographic regions of study area. As far as the input structure is concerned, the planting material is the most expensive item in three physiographic regions of the study area.This study shows that flower cultivation is a prospective business which ensures higher profitability.It can not only play a vital role in employment generation and poverty reduction but also can contribute in the national economy through earning foreign currency. But the commercial development of the business is still at very early stage. After analyzing the cost benefit ratio of the floriculture in the study area shows that the floriculture is economically viable crop. The physiographic region of the study area shows the different result. Gladiolus and lillium flower gives the maximum profit in foothill while in valley floor and karewas the rose flower shows the maximum profit. After comparing the profitability of floriculture with the other crops the result came that the floriculture is economically viabile crop. For increasing the production of the floriculture we should use the hybrid planting material and should avoid the recycling use of the planting material.

## ACKNOWLEDGEMENT

I would like to thank my esteemed guide Dr. Harmeet Singh for his meritorious guidance and affection during the whole work. His timely suggestions were valuable in the whole period of work. sincere thanks department of floriculture (SKAUST), Meteorological department Srinagar for their assistance and providing data. I would also like to thank the coauthor of this paper for his contribution during the work and shown good team work. i would also like thanks the authors, publishers etc. whose vast experience I use during my work in form. Last but not least I would like to thank my family and my husband for their support in terms of both financial and emotional without which nothing was possible,
