Abstract: The Fuzzy set theory has been applied in many fields such as management, engineering and almost in every business enterprise as well as day to day activities. Ordering fuzzy numbers plays an important role in approximate reasoning, optimization, forecasting, decision making, risk analysis, controlling, scheduling and various other usages in our day to day activities. This paper describes a ranking method for ordering fuzzy numbers based on Area, Mode, divergence, Spreads and Weights of generalized (non-normal) hexagonal fuzzy numbers.

Keywords: Ranking function, Hexagonal fuzzy numbers, Centroid points, Area

I. Introduction

Ranking fuzzy number is used mainly in data analysis, artificial intelligence and various other fields of operations research. In fuzzy environment ranking fuzzy numbers is a very important in decision making procedure. Ranking fuzzy numbers were first proposed by Jain [1] for decision making in fuzzy situations by representing the ill-defined quantity as a fuzzy set. Some of these ranking methods have been compared and reviewed by Bortolan and Degani [2], and more recently by Chen and Hwang [3]. Lee and Li [4] proposed the comparison of fuzzy numbers. Liou and Wang [5] presented ranking fuzzy numbers with interval values. The centroids of fuzzy numbers have been examined recently. One of the most commonly used methods under the class of fuzzy scoring is the centroid point method. Cheng [6] used a centroid based distance method to rank fuzzy numbers in 1998. Then Chu and Tsao[7] utilized the area between the centroid point and the origin to rank fuzzy numbers in 2002. Abbasbandi and Asady[8] suggested a sign distance method for ranking fuzzy numbers in 2006. Wang Y.J and Lee.H.S[9] proposed the revised method of ranking fuzzy numbers with an area between the centroid and original points in 2008. Since then several methods have been proposed by various researchers which includes ranking fuzzy numbers using maximizing and minimizing set[10] decomposition principle and signed distance[11]. different heights and spreads[12], rank, mode, divergence and spread [13], area compensation distance method[14], Ordering of trapezoidal fuzzy numbers[15].

II. Preliminaries

2.1 DEFINITION: [16]

The Characteristic function $\mu_{\tilde{A}}(x)$ of a crisp set $A \subseteq X$ assigns a value of either 1 or 0 to each individual in the universal set $X$. This function can be generalized to a function $\mu_{\tilde{A}}$ such that the value assigned to the element of the universal set $X$ fall within a specified range (i.e) $\mu_{\tilde{A}} : X \rightarrow [0,1]$. The assigned value indicates the membership grade of the element in the set $A$. The function $\mu_{\tilde{A}}$ is called the membership function and the set $\tilde{A} = \{(x, \mu_{\tilde{A}}(x))/x \in X\}$ define by $\mu_{\tilde{A}}$ for each $x \in X$ is called a fuzzy set.

2.2 DEFINITION: [16]

A fuzzy set $\tilde{A}$ defined on the universal set of real numbers $R$ is said to be a fuzzy number of its membership function has the following characteristics

(i) $\mu_{\tilde{A}} : R \rightarrow [0,1]$ is continuous
(ii) $\mu_{\tilde{A}}(x) = 0$ for all $x \in [-\infty, a_1] \cup [a_4, \infty]$
(iii) $\mu_{\tilde{A}}(x)$ is strictly increasing on $[a_1, a_2]$ and strictly decreasing on $[a_3, a_4]$
(iv) $\mu_{\tilde{A}}(x) = 1$ for all $x \in [a_2, a_3]$, where $a_1 \leq a_2 \leq a_3 \leq a_4$
2.3 DEFINITION: [16]

A fuzzy set \( \tilde{A} \) defined on the universal set of real numbers R is said to be generalized fuzzy number of its membership function has the following characteristics

(i) \( \mu_{\tilde{A}} : R \to [0,1] \) is continuous

(ii) \( \mu_{\tilde{A}}(x) = 0 \) for all \( x \in [-\infty, a_1] \cup [a_4, \infty] \)

(iii) \( \mu_{\tilde{A}}(x) \) is strictly increasing on \([a_1, a_2]\) and strictly decreasing on \([a_3, a_4]\)

(iv) \( \mu_{\tilde{A}}(x) = w \) for all \( x \in [a_2, a_3] \), where \( 0 < w \leq 1 \)

2.4 DEFINITION: [16]

A fuzzy number \( A \) is a trapezoidal fuzzy number denoted by \((a_1, a_2, a_3, a_4)\) and its membership function is given below, where \( a_1 \leq a_2 \leq a_3 \leq a_4 \)

\[
\mu_{A}(x) = \begin{cases} 
0 & \text{for } x < a_1 \\
\frac{(x-a_2)}{(a_2-a_1)} & \text{for } a_1 \leq x \leq a_2 \\
1 & \text{for } a_2 \leq x \leq a_3 \\
\frac{(a_4-x)}{(a_4-a_3)} & \text{for } a_3 \leq x \leq a_4 \\
0 & \text{for } x > a_4 
\end{cases}
\]

2.5 DEFINITION: [16]

A generalized fuzzy number \( \tilde{A} = (a_1, a_2, a_3, a_4; w) \) is said to be a generalized trapezoidal fuzzy number if its membership function is given by

\[
\mu_{\tilde{A}}(x) = \begin{cases} 
w\left(\frac{x-a_1}{a_2-a_1}\right), & a_1 \leq x \leq a_2 \\
w, & a_2 \leq x \leq a_3 \\
w\left(\frac{a_4-x}{a_4-a_3}\right), & a_3 \leq x \leq a_4 
\end{cases}
\]

III. Hexagonal Fuzzy Numbers

3.1 DEFINITION: [17]

A fuzzy number \( \tilde{A}_H \) is a hexagonal fuzzy number denoted by \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6) \) where \( a_1, a_2, a_3, a_4, a_5, a_6 \) are real numbers and its membership function \( \mu_{\tilde{A}_H}(x) \) is given below.

\[
\mu_{\tilde{A}_H}(x) = \begin{cases} 
0 & \text{for } x < a_1 \\
\frac{1}{2}\left(\frac{x-a_1}{a_2-a_1}\right) & \text{for } a_1 \leq x \leq a_2 \\
\frac{1}{2}\left(\frac{x-a_2}{a_3-a_2}\right) & \text{for } a_2 \leq x \leq a_3 \\
1 - \frac{1}{2}\left(\frac{x-a_3}{a_4-a_3}\right) & \text{for } a_3 \leq x \leq a_4 \\
\frac{1}{2}\left(\frac{a_4-x}{a_5-a_4}\right) & \text{for } a_4 \leq x \leq a_5 \\
\frac{1}{2}\left(\frac{a_5-x}{a_6-a_5}\right) & \text{for } a_5 \leq x \leq a_6 \\
0 & \text{for } x > a_6 
\end{cases}
\]
3.2 DEFINITION: [17]

A generalized fuzzy number \( \tilde{A}_H \) is a hexagonal fuzzy number denoted by \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6, w) \) where \( a_1, a_2, a_3, a_4, a_5, a_6 \) are real numbers and its membership function \( \mu_{\tilde{A}_H}(x) \) is given below.

\[
\mu_{\tilde{A}_H}(x) = \begin{cases} 
0 & \text{for } x < a_1 \\
\frac{1}{2} \left( \frac{x-a_1}{a_2-a_1} \right) & \text{for } a_1 \leq x \leq a_2 \\
\frac{1}{2} + \frac{1}{2} w \left( \frac{x-a_2}{a_3-a_2} \right) & \text{for } a_2 \leq x \leq a_3 \\
\frac{w}{2} \left( \frac{x-a_2}{x-a_4} \right) & \text{for } a_3 \leq x \leq a_4 \\
1 - \frac{w}{2} \left( \frac{x-a_4}{a_5-x} \right) & \text{for } a_4 \leq x \leq a_5 \\
\frac{1}{2} \left( \frac{a_6-x}{a_6-a_4} \right) & \text{for } a_5 \leq x \leq a_6 \\
0 & \text{for } x > a_6 
\end{cases}
\]

3.3 ORDERING OF HEXAGONAL FUZZY NUMBER: [18]

Let \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6, w) \) and \( \tilde{B}_H = (b_1, b_2, b_3, b_4, b_5, b_6, w) \) be in \( F(R) \) be the set of all real hexagonal fuzzy numbers

i) \( \tilde{A}_H \approx \tilde{B}_H \) if and only if \( a_i = b_i \), \( i=1,2,3,4,5,6 \)

ii) \( \tilde{A}_H \leq \tilde{B}_H \) if and only if \( a_i \leq b_i \), \( i=1,2,3,4,5,6 \)

iii) \( \tilde{A}_H \geq \tilde{B}_H \) if and only if \( a_i \geq b_i \), \( i=1,2,3,4,5,6 \)

3.4 RANKING OF HEXAGONAL FUZZY NUMBERS: [18]

An efficient approach for comparing the fuzzy numbers is by the use of a ranking function \( R: F(R) \rightarrow R \), where \( F(R) \) is a set of fuzzy numbers defined on set of real numbers, which maps each fuzzy number into a real number, where a natural order exists. For any two hexagonal fuzzy numbers \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6, w) \) and \( \tilde{B}_H = (b_1, b_2, b_3, b_4, b_5, b_6, w) \) we have the following comparison

i) \( \tilde{A}_H \approx \tilde{B}_H \iff R(\tilde{A}_H) = R(\tilde{B}_H) \)

ii) \( \tilde{A}_H \geq \tilde{B}_H \iff R(\tilde{A}_H) \geq R(\tilde{B}_H) \)

iii) \( \tilde{A}_H \leq \tilde{B}_H \iff R(\tilde{A}_H) \leq R(\tilde{B}_H) \)

III. Proposed ranking Method

![Fig.1 Generalized hexagonal fuzzy number](image)

The centroid of a hexagonal fuzzy number is considered to be the balancing point of the hexagon (Fig.1). Divide the hexagonal into three plane figures. These three plane figures are a Triangle ABQ, Hexagon CDERQB and again a triangle REF respectively. The circumcenter of the centroids of these three plane figures.
Ordering Generalized Hexagonal Fuzzy Numbers using Rank, Mode, Divergence and Spread

is taken as the point of reference to define the ranking of generalized Hexagonal fuzzy numbers. Let the centroid of the three plane figures be \( G_1, G_2, G_3 \), respectively.

The centroid of the three plane figures is

\[
G_1 = \left( \frac{a_1+a_2+a_3}{3}, \frac{a_4+a_5+a_6}{3}, \frac{w}{6} \right) ; \quad G_2 = \left( \frac{a_1+2a_2+2a_3}{6}, \frac{a_4+2a_5+2a_6}{6}, \frac{w}{2} \right) ; \quad G_3 = \left( \frac{a_4+a_5+a_6}{3}, \frac{w}{6} \right)
\]

Equation of the line \( G_1G_2 \) is \( y = \frac{w}{6} \) and \( G_2 \) does not lie on the line \( G_1G_3 \).

Therefore \( G_1, G_2 \) and \( G_3 \) are non-collinear and they form a triangle. We define the centroid of the triangle with vertices \( G_1, G_2 \) and \( G_3 \) of the generalized hexagonal fuzzy number \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w) \) as

\[
\tilde{G}_H = \left( \frac{2a_1 + 3a_2 + 4a_3 + 4a_4 + 3a_5 + 2a_6}{18}, \frac{5w}{18} \right)
\]  

The ranking function of the generalized hexagonal fuzzy number \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w) \), which maps the set of all fuzzy numbers to a set of real numbers is defined as:

\[
R(\tilde{A}_H) = \left( \frac{x}{y_0} \right) = \left( \frac{2a_1 + 3a_2 + 4a_3 + 4a_4 + 3a_5 + 2a_6}{18} \right)
\]

The mode of the generalized hexagonal fuzzy number \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w) \) is defined as:

\[
Mode = \frac{1}{2} \int_0^w (a_3 + a_4) dx
\]

The divergence of the generalized hexagonal fuzzy number \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w) \) is defined as

\[
Divergence = \int_0^w (a_6 - a_1) dx
\]

The left spread of the generalized hexagonal fuzzy number \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w) \) is defined as

\[
Leftspread = \int_0^w (a_2 - a_1) dx + \int_0^w (a_3 - a_2) dx
\]

\[
Leftspread = \int_0^w (a_1 - a_1) dx
\]

The right spread of the generalized hexagonal fuzzy number \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w) \) is defined as

\[
Rightspread = \int_0^w (a_6 - a_5) dx + \int_0^w (a_5 - a_4) dx
\]

\[
Rightspread = \int_0^w (a_6 - a_5) dx
\]

4.1. PROPOSITION:

If \( \tilde{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w_1) \) and \( \tilde{B}_H = (b_1, b_2, b_3, b_4, b_5, b_6; w_2) \) are two generalized Hexagonal fuzzy numbers then

(i) \( R(\tilde{A}_H) = R(\tilde{B}_H) \)

(ii) \( \text{Mode}(\tilde{A}_H) = \text{Mode}(\tilde{B}_H) \)

(iii) \( \text{Divergence}(\tilde{A}_H) = \text{Divergence}(\tilde{B}_H) \) then,
Ordering Generalized Hexagonal Fuzzy Numbers using Rank, Mode, Divergence and Spread

(a) Left spread($\hat{A}_H$) > Left spread($\hat{B}_H$) if $w_1 a_3 > w_2 b_3$
(b) Left spread($\hat{A}_H$) < Left spread($\hat{B}_H$) if $w_1 a_3 < w_2 b_3$
(c) Left spread($\hat{A}_H$) = Left spread($\hat{B}_H$) if $w_1 a_3 = w_2 b_3$

Proof:
From the assumptions
(i) $R(\hat{A}_H) = R(\hat{B}_H)$

\[ w_1 \left( 2a_1 + 3a_2 + 4a_3 + 5a_4 + 6a_5 \right) \left( \frac{5}{18} \right) = w_2 \left( 2b_1 + 3b_2 + 4b_3 + 5b_4 + 6b_5 \right) \left( \frac{5}{18} \right) \]

(i.e.) $w_1 (2a_1 + 3a_2 + 4a_3 + 5a_4 + 6a_5) = w_2 (2b_1 + 3b_2 + 4b_3 + 5b_4 + 6b_5)$ -- (7)

(ii) Mode($\hat{A}_H$) = Mode($\hat{B}_H$)

(i.e.) $w_1 (a_3 + a_4) = w_2 (b_3 + b_4)$ -- -- -- (8)

(iii) Divergence($\hat{A}_H$) = Divergence($\hat{B}_H$)

(i.e.) $w_1 (a_1 - a_1) = w_2 (b_1 - b_1)$ -------------- (9)

Solving (7), (8) and (9)

\[ w_1 a_3 = w_2 b_3 \]

\[ w_1 a_6 = w_2 b_6 \]

\[ w_1 (a_3 + a_4) = w_2 (b_3 + b_4) \]

\[ w_1 (a_2 + a_3) = w_2 (b_2 + b_3) \]

4.1.1 Corollary:
All the results of proposition 4.1 also hold for right spread.

4.2 Proposed approach for ranking generalized hexagonal fuzzy number:
If $\hat{A}_H = (a_1, a_2, a_3, a_4, a_5, a_6; w_1)$ and $\hat{B}_H = (b_1, b_2, b_3, b_4, b_5, b_6; w_2)$ are two generalized hexagonal fuzzy numbers then

Step 1
Find $R(\hat{A}_H)$ and $R(\hat{B}_H)$

Case (i) If $R(\hat{A}_H) > R(\hat{B}_H)$ then $\hat{A}_H > \hat{B}_H$
Case (ii) If $R(\hat{A}_H) < R(\hat{B}_H)$ then $\hat{A}_H < \hat{B}_H$
Case (iii) If \( R(\tilde{A}_H) = R(\tilde{B}_H) \), then \( \tilde{A}_H = \tilde{B}_H \) then go to Step 2

**Step 2**

Find mode \((\tilde{A}_H)\) and mode \((\tilde{B}_H)\)

Case (i) If mode \((\tilde{A}_H) > \) mode \((\tilde{B}_H)\) then \( \tilde{A}_H > \tilde{B}_H \)
Case (ii) If mode \((\tilde{A}_H) < \) mode \((\tilde{B}_H)\) then \( \tilde{A}_H < \tilde{B}_H \)
Case (iii) If mode \((\tilde{A}_H) = \) mode \((\tilde{B}_H)\) then \( \tilde{A}_H = \tilde{B}_H \) then go to Step 3

**Step 3**

Find divergence \((\tilde{A}_H)\) and mode \((\tilde{B}_H)\)

Case (i) If divergence \((\tilde{A}_H) > \) divergence \((\tilde{B}_H)\) then \( \tilde{A}_H > \tilde{B}_H \)
Case (ii) If divergence \((\tilde{A}_H) < \) divergence \((\tilde{B}_H)\) then \( \tilde{A}_H < \tilde{B}_H \)
Case (iii) If divergence \((\tilde{A}_H) = \) divergence \((\tilde{B}_H)\) then \( \tilde{A}_H = \tilde{B}_H \) then go to Step 4

**Step 4**

Find Left spread \((\tilde{A}_H)\) and Left spread \((\tilde{B}_H)\)

Case (i) Left spread \((\tilde{A}_H) > \) Left spread \((\tilde{B}_H)\)

i.e. \( w_1 a_3 > w_2 b_3 \) then \( \tilde{A}_H > \tilde{B}_H \) (from proposition 4.1.)

Case (ii) Left spread \((\tilde{A}_H) < \) Left spread \((\tilde{B}_H)\)

i.e. \( w_1 a_3 < w_2 b_3 \) then \( \tilde{A}_H < \tilde{B}_H \) (from proposition 4.1.)

Case (iii) Left spread \((\tilde{A}_H) = \) Left spread \((\tilde{B}_H)\)

i.e. \( w_1 a_3 = w_2 b_3 \) then \( \tilde{A}_H = \tilde{B}_H \) (from proposition 4.1.)

**Step 5**

Find \( w_1 \) and \( w_2 \)

Case (i) If \( w_1 > \) \( w_2 \) then \( \tilde{A}_H > \tilde{B}_H \)
Case (ii) If \( w_1 < \) \( w_2 \) then \( \tilde{A}_H < \tilde{B}_H \)
Case (iii) If \( w_1 = \) \( w_2 \) then \( \tilde{A}_H = \tilde{B}_H \)

IV. **Result and Discussions**

**Example: 1**

Let \( \tilde{A}_H = (0.02, 0.03, 0.05, 0.06, 0.08, 0.09, 0.7) \) and \( \tilde{B}_H = (0.04, 0.06, 0.1, 0.12, 0.16, 0.18, 0.35) \)

**Step 1**

\( R(\tilde{A}_H) = 0.693 \), \( R(\tilde{B}_H) = 0.693 \), Since \( R(\tilde{A}_H) = R(\tilde{B}_H) \) go to Step 2

**Step 2**

Mode \((\tilde{A}_H) = 0.077 \), Mode \((\tilde{B}_H) = 0.077 \), Since Mode \((\tilde{A}_H) = \) Mode \((\tilde{B}_H)\) go to Step 3

**Step 3**

Divergence \((\tilde{A}_H) = 0.049 \), Divergence \((\tilde{B}_H) = 0.049 \), Since Divergence \((\tilde{A}_H) = \) Divergence \((\tilde{B}_H)\) go to Step 4

**Step 4**

Left spread \((\tilde{A}_H) = 0.021 \), Left spread \((\tilde{B}_H) = 0.021 \), Since Left spread \((\tilde{A}_H) = \) Left spread \((\tilde{B}_H)\) go to Step 5

**Step 5**
V. Conclusion

In this paper, a hexagonal fuzzy ranking is used for centroid of a triangle from an earlier version. [17, 18] In this ranking method we have used rank, mode, divergence and spreads are used and we infer the results found were satisfactory and the conditions are satisfied and this has been proved with illustrative examples and if more number of parameters also taken we can make the decision making process simple in working on risk and uncertainty with optimized ranking order. This ranking procedure can be applied in various decision making problems such as, fuzzy optimization, Fuzzy AHP.
