# Existence and Uniqueness result for Boundary value problems involving capillarity problems 

M.B.Okofu<br>Department of Mathematics, University of Nigeria, Nsukka, Nigeria. [2010]47H05, 47H09 Monotone operator; generalized p-Laplacian operator; non-linear boundary value problem; capillarity problem.

#### Abstract

In this paper, we study a nonlinear boundary value problem (bvp) which generalizes capillarity problem. An existence and uniqueness result is obtained using the knowledge of range for nonlinear operator. Ours extends the result in [12].

## I. Introduction

A research on the existence and uniqueness result for certain nonlinear boundary value problems of capillarity problem has a close relationship with practical problems. Some significant work has been done on this, see Wei et al. [Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found.]. In 1995, Wei and He [Error! Reference source not found.] used a perturbation result of ranges for maccretive mappings in Calvert and Gupta [Error! Reference source not found.] to obtain a sufficient condition so that the zero boundary value problem,
$-\nabla_{\mathrm{p}} \mathrm{u}+\mathrm{g}(\mathrm{x}, \mathrm{u}(\mathrm{x}))=\mathrm{f}(\mathrm{x})$, a.e in $\Omega$,
$E Q-\backslash F(\partial u, \partial n)=0 \backslash$,a.e in $\Gamma \backslash$,
has solutions in $\mathrm{L}^{\mathrm{p}}(\Omega)$, where $2 \leq \mathrm{p}<+\infty$. In 2008, as a summary of the work done in[Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found., Error! Reference source not found.], Wei et al used some new technique to work for the following problem with so-called generalized p-Laplacian operator:
$-\operatorname{div}\left[\left(\mathrm{c}(\mathrm{x})+|\nabla \mathrm{u}|^{2}\right)^{(\mathrm{p}-2) / 2} \nabla \mathrm{u}\right]+\varepsilon|\mathrm{u}|^{\mathrm{q}-2} \mathrm{u}+\mathrm{g}(\mathrm{x}, \mathrm{u}(\mathrm{x}))=\mathrm{f}(\mathrm{x})$, a.e in $\Omega$
EQ $-\langle\mathrm{v} \backslash,(\mathrm{c}(\mathrm{x})+|\nabla \mathrm{u}| \sin \backslash \operatorname{up} 5(2)) \backslash \mathrm{s} \backslash u p 5(\backslash \mathrm{~F}()),(\mathrm{p}-2) 2 \nabla \mathrm{u}\rangle \in \beta \backslash \mathrm{s} \backslash \operatorname{do5}(\mathrm{x})(\mathrm{u}(\mathrm{x})) \backslash$, a.e in $\Gamma$
where $0 \leq \mathrm{c}(\mathrm{x}) \in \mathrm{L}^{\mathrm{p}}(\Omega), \varepsilon$ is a non-negative constant and v denotes the exterior normal derivatives of $\Gamma$. It was shown in [7] that (1.2) has solutions in $L^{p}(\Omega)$ under some conditions where $2 N /(N+1)<p \leq s<+\infty, 1 \leq q<+\infty$ if $p \geq N$, and $1 \leq q \leq N / p /(N-p)$ if $p<N$, for $N \geq 1$. In Chen lup[8], the authors studied the eigenvalue problem for the following generalized capillarity equations:
$-\operatorname{div}\left[\left(1+\frac{|\nabla \mathbf{u}|^{\mathrm{p}}}{\sqrt{1+|\nabla \mathbf{u}|^{2 p}}}\right)|\nabla \mathbf{u}|^{(\mathrm{p}-2)} \nabla \mathbf{u}\right]=\lambda\left(|\mathbf{u}|^{\mathrm{q}-2} \mathbf{u}+|\mathbf{u}|^{\mathrm{r}-2} \mathrm{u}\right)$, in $\Omega$,

$$
\mathrm{EQ} \mathrm{u}=0 \backslash \text {,a.e. on } \partial \Omega \text {. }
$$

In their paper [10], Wei et al, borrowed the main ideas dealing with the nonlinear elliptic boundary value problem with the generalized p-Laplacian operator to study the nonlinear generalized Capillarity equations with Neumann boundary conditions. They used the perturbation results of ranges for m-accretive mappings in [Error! Reference source not found.] again to study
$\left.-\left.\left\langle\mathrm{v},\left(1+\frac{|\nabla \mathrm{u}|^{\mathrm{p}}}{\sqrt{1+|\nabla \mathrm{u}|^{2 p}}}\right)\right| \nabla \mathrm{u}\right|^{(\mathrm{p}-2)} \nabla \mathrm{u}\right\rangle \in \beta_{\mathrm{x}}(\mathrm{u}(\mathrm{x}))$, a.e on $\Gamma$
Motivated by [10, 12], we study the following boundary value problem:

$\left.-\left.\left\langle\mathrm{v},\left(1+\frac{|\nabla \mathrm{u}|^{\mathrm{p}}}{\sqrt{1+|\nabla \mathrm{u}|^{2 \mathrm{p}}}}\right)\right| \nabla \mathrm{u}\right|^{(\mathrm{p}-2)} \nabla \mathrm{u}\right\rangle \in \beta_{\mathrm{x}}(\mathrm{u}(\mathrm{x}))$, a.e in $\Gamma$
This equation generalized the Capillarity problem considered in [10]. We replaced the nonlinear term $\mathrm{g}(\mathrm{x}, \mathrm{u}(\mathrm{x}))$ by the term $\mathrm{g}(\mathrm{x}, \mathrm{u}(\mathrm{x}), \nabla \mathrm{u}(\mathrm{x}))$ which is rather general. In this paper, we will use some perturbation results of the ranges for maximal monotone operators by Pascali and Shurlan [10] to prove that (Error! Reference source not found.) has a unique solution in $\mathrm{W}^{1, \mathrm{p}}(\Omega)$ and later show that this unique solution is the zero of a suitably defined maximal monotone operator.

## II. Preliminaries

We now list some basic knowledge we need. Let X be a real Banach space with a strictly convex dual space $X^{*}$.Using " $\hookrightarrow "$ and " $w$-lim" to denote strong and weak convergence respectively. For any subset G of X, let int $G$ denote its interior and $G$ its closure. Let " $\mathrm{X} \hookrightarrow \hookrightarrow Y$ " denote that space X is embedded compactly in space $Y$ and " $\mathrm{X} \hookrightarrow \mathrm{Y}^{\prime}$ denote that space X is embedded continuously in space Y . A mapping, $\mathrm{T}: \mathrm{D}(\mathrm{T})=\mathrm{X} \rightarrow \mathrm{X}^{*}$ is said to be hemicontinuous on $X$ if $w-{ }_{t \rightarrow 0} T(x+t y)=T x$, for any $x, y \in X$ Let $J$ denote the duality mapping from $X$ into $2^{x}$ , defined by
$f(x)=f \in x^{*}:(x, f)=\|x\| \cdot\|f\|,\|f\|=\|x\|, x \in X$
where (.,.) denotes the generalized duality pairing between $X$ and $X^{*}$ Let $A: X \rightarrow 2^{X}$ be a given multi-valued mapping, A is boundedly-inversely compact if for any pair of bounded subsets $G$ and $G^{\prime}$ of $X$, the subset $\mathrm{GA}^{-1}\left(\mathrm{G}^{\prime}\right)$ is re latively co mpact in X .
The mapping $A: X \rightarrow 2$ is said to be accretive if $\left(\left(v_{1}-v_{2}\right), J\left(u_{1}-u_{2}\right)\right) \geq 0$, for any $u_{i} \in D(A)$ and $v_{i} \in A u_{i} ; i=1,2$.
The accretive mapping A is said to be m-accretive if $\mathrm{R}(\mathrm{I}+\mu \mathrm{A})=\mathrm{X}$, for some $\mu>0$.
Let $B: X \rightarrow 2 X^{*}$ be a given multi-valued mapping, the graph of $B, G(B)$ is defined by $G(B)=\{[u, w] \mid$ $u \in D(B), w \in B u\} . B: X \rightarrow 2^{*}$ is said to be monotone [11] if $G(B)$ is a monotone subset of $X \times X^{*}$ in the sense that
$\left(\mathrm{u}_{1}-\mathrm{u}_{2}, \mathrm{w}_{1}-\mathrm{w}_{2}\right) \geq 0$, for any $\left[\mathrm{u}_{\mathrm{i}}, \mathrm{w}_{\mathrm{i}}\right] \in \mathrm{G}(\mathrm{B}) ; \mathrm{i}=1,2$.
The monotone operator $B$ is said to be maximal monotone if $G(B)$ is maximal among all monotone subsets of $\mathrm{X} \times \mathrm{X}^{*}$ in the sense of inclusion the mapping B is said to be strictly monotone if the equality in (Error! Reference source not found.) implies that $u_{1}=u_{2}$. The mapping $B$ is said to be coercive if $\lim _{\mathrm{n} \rightarrow+\infty}\left(\left(\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}}\right) /\left\|\mathrm{x}_{\mathrm{n}}\right\|\right)=\infty$ for all $\left[\mathrm{x}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}}\right] \in \mathrm{G}(\mathrm{B})$ such that $\lim _{\mathrm{n} \rightarrow+\infty}\left\|\mathrm{x}_{\mathrm{n}}\right\|=+\infty$.
Definition 1 The duality mapping $\mathrm{J}: \mathrm{X} \rightarrow 2^{*}$ is said to be satisfying condition (I) if there exists a function $\eta: X \rightarrow[0,+\infty) \quad$ such that

$$
\|J u-J v\| \leq \eta(u-v) \text {, for all } u, v \in X .
$$

Definition 2 Let $A: X \rightarrow 2$ be an accretive mapping and $J: X \rightarrow X$ be a duality mapping. We say that A satisfies condition (*) if, for any $f \in R(A)$ and $a \in D(A)$ and $a \in D(A)$, there exists a constant $C(a, F)$ such that

$$
(v-f, J(u-a)) \geq C(a, f) \text {, for any } u \in D(A), v \in A u \text {. }
$$

Lemma 3 (Li and Guo) Let $\Omega$ be a bounded conical do main in $\mathrm{R}^{\mathrm{N}}$. Then we have the following results;

1. If $\mathrm{mp}>\mathrm{N}$ then $\mathrm{W}^{\mathrm{m}, \mathrm{p}}(\Omega) \hookrightarrow \mathrm{C}_{\mathrm{B}}(\Omega)$; if $\mathrm{mp}<\mathrm{N}$ and $\mathrm{q}=\mathrm{Np} /(\mathrm{N}-\mathrm{mp})$, then $\mathrm{W}^{\mathrm{m}, \mathrm{p}}(\Omega) \hookrightarrow \mathrm{L}^{\mathrm{q}}(\Omega)$; if $\mathrm{mp}=\mathrm{N}$, and $\mathrm{p}>1$, then for $1 \leq \mathrm{q}<+\infty, \mathrm{W}^{\mathrm{m}, \mathrm{p}}(\Omega) \rightarrow \mathrm{L}^{\mathrm{q}}(\Omega)$
2. If $\mathrm{mp}>\mathrm{N}$ then $\mathrm{W}^{\mathrm{m}, \mathrm{p}}(\Omega) \hookrightarrow \hookrightarrow \mathrm{C}_{\mathrm{B}}(\Omega)$; if $0<\mathrm{mp} \leq \mathrm{N} \quad$ and $\mathrm{q}_{0}=\mathrm{Np} /(\mathrm{N}-\mathrm{mp})$, then $\mathrm{W}^{\mathrm{m}, \mathrm{p}}(\Omega) \hookrightarrow \hookrightarrow \mathrm{L}^{\mathrm{q}}(\Omega), 1 \leq \mathrm{q}^{<\mathrm{q}_{0}} \quad ;$

Lemma 4 (Pascali and Sburlan[11]) If $\mathrm{B}: \mathrm{X} \rightarrow 2^{\mathrm{X}^{*}}$ is an everywhere defined, monotone and hemicontinuous operator, then B is maximal monotone.
Lemma 5 (Pascali and Sburlan[11]). If $B: X \rightarrow 2^{X^{*}}$ is maximal monotone and coercive, then $R(B)=X^{*}$
Lemma 6 (Pascali and Sburlan[11]). If $\Phi: X \rightarrow(-\infty,+\infty$ ]
is a proper, convex and lower semicontinuous function, then $\partial \Phi$ is maximal monotone from X to $\mathrm{X}^{*}$.
Lemma 7 [Error! Reference source not found.]. If $B_{1}$ and $B_{2}$ are two maximal monotone operators in $X$ such that $\left(\operatorname{intD}\left(B_{1}\right)\right) D\left(B_{2}\right) \neq \varnothing$, then $B_{1}+B_{2}$ is maximal monotone.
Lemma 8 (Calvert and Gupta[1]). Let $\mathrm{X}=\mathrm{L}^{\mathrm{p}}(\Omega)$ and $\Omega$ be a bounded domain in $\Re^{\mathrm{N}}$. For $2 \leq \mathrm{p}<+\infty$, the duality mapping $J_{p}: L^{p}(\Omega) \rightarrow L^{p^{\prime}}(\Omega)$ defined by $J_{P} u=|u|^{p-1}$ sgn $u\|u\|_{p}^{2-p}$, for $u \in L^{P}(\Omega)$, satisfies condition (2); for $2 N /(N+1)<p \leq 2$ and $N \geq 1$, the duality mapping $J_{p}: L^{p}(\Omega) \rightarrow L^{p^{\prime}}(\Omega)$ defined by $J_{P} u=|u|^{p-1}$ sgn $u$, for $u \in L^{P}(\Omega)$, satisfies condition (2), where $(1 / \mathrm{p})+\left(1 / \mathrm{p}^{\prime}\right)=1$

## III. Main Result

3.1 Notations and Assumptions of (Error! Reference source not found.)

We assume, in this paper, that $2 \mathrm{~N} /(\mathrm{N}+1)<\mathrm{p}<+\infty, 1 \leq \mathrm{q}_{1}, \mathrm{q}_{2}, \cdots, \mathrm{q}_{\mathrm{m}}<+\infty \quad$ if $\mathrm{p} \geq \mathrm{N}$, and
 denote the norms in $L^{p}(\Omega), \mathrm{L}^{\mathrm{q}_{1}}(\Omega), \mathrm{L}^{\mathrm{q}_{2}(\Omega), \cdots, \mathrm{L}^{\mathrm{q}_{\mathrm{m}}^{(\Omega)}}}$ and $\mathrm{W}^{1, \mathrm{p}}(\Omega)$ respectively. Let $(1 / \mathrm{p})+\left(1 / \mathrm{p}^{\prime}\right)=1,\left(1 / \mathrm{q}_{1}\right)+\left(1 / \mathrm{q}_{1}{ }^{\prime}\right)=1,\left(1 / \mathrm{q}_{2}\right)+\left(1 / \mathrm{q}_{2}{ }^{\prime}\right)=1, \cdots,\left(1 / \mathrm{q}_{\mathrm{m}}\right)+\left(1 / \mathrm{q}_{\mathrm{m}}{ }^{\prime}\right)=1$
In (Error! Reference source not found.), $\Omega$ is a bounded conical domain of a Euclidean space $\mathfrak{R}^{\mathrm{N}}$ with its boundary $\Gamma \in \mathrm{C}^{1}$,(c.f.[4]).
Let |.| denote the Euclidean norm in $\mathfrak{R}^{\mathrm{N}},\langle. .$,$\rangle \quad the Euclidean inner-product and v$ the exterior normal derivative of $\Gamma . \lambda$ is a nonnegative constant.
Lemma 1 Define the mapping $\mathrm{B}_{\mathrm{p}, \mathrm{q}_{1}, \mathrm{q}_{2}, \cdots, \mathrm{q}_{\mathrm{m}}}: \mathrm{W}^{1, \mathrm{p}}(\Omega) \rightarrow\left(\mathrm{W}^{1, \mathrm{p}}(\Omega)\right)^{*} \quad$ by

$$
\begin{aligned}
& \left.\left(\mathrm{v}, \mathrm{~B}_{\mathrm{p}, \mathrm{q}_{1}, \mathrm{q}_{2}, \cdots, \mathrm{q}_{\mathrm{m}}} \mathrm{u}\right) \quad=\left.\quad \int_{\Omega}\left\langle\left(1+\frac{|\nabla \mathrm{u}|^{\mathrm{p}}}{\sqrt{1+|\nabla \mathrm{u}|^{2 \mathrm{p}}}}\right)\right| \nabla \mathrm{u}\right|^{\mathrm{p}-2} \nabla \mathrm{u}, \nabla \mathrm{v}\right\rangle \mathrm{dx} \\
& \lambda \int_{\Omega}|u(x)|^{q_{1}}{ }^{-2} u(x) v(x) d x+\lambda \int_{\Omega}|u(x)|^{q_{2}}{ }^{-2} u(x) v(x) d x \\
& +\quad \cdots+\lambda \int_{\Omega}|u(x)|^{q_{m}}{ }^{-2} u(x) v(x) d x
\end{aligned}
$$

for any $u, v \in W^{1, p}(\Omega) \quad$.Then $B_{p, q_{1}, q_{2}}, \cdots, q_{m}$
is everywhere defined, strictly monotone, hemicontinuous and coercive.
The proof of the above lemma will be done in four steps:
[Sorry. Ignored \begin\{proof\} ... \end\{proof\}] }
Definition 2 Define a mapping $\mathrm{A}_{\mathrm{p}}: \mathrm{L}^{\mathrm{p}}(\Omega) \rightarrow 2{ }^{\mathrm{L}}{ }^{\mathrm{p}(\Omega)}$ as follows:
$D\left(A_{p}\right)=\left\{u \in L^{p}(\Omega) \mid\right.$ there exist an $f \in L^{p}(\Omega)$, such that $\left.f \in B_{p, q_{1}, q_{2}, \cdots, q_{m}} u+\partial \Phi_{p}(u)\right\}$
$E Q$ for $u \in D(A \backslash s \backslash \operatorname{do5}(p)) \backslash$, let $A \backslash s \backslash \operatorname{do5}(p) u=\{f \in \operatorname{L} \backslash \operatorname{s} \backslash u p 5(p)(\Omega) \backslash$, such that $f \in$
$\mathrm{B} \backslash \mathrm{s} \backslash \operatorname{do5}(\mathrm{p} \backslash \mathrm{q} \backslash \mathrm{s} \backslash \operatorname{do} 4(1) \backslash \mathrm{q} \backslash \mathrm{s} \backslash \operatorname{do} 4(2) \backslash, \cdots \backslash, \mathrm{q} \backslash \mathrm{s} \backslash \operatorname{do} 4(\mathrm{~m}) \mathrm{u}+\partial \Phi \backslash \mathrm{s} \backslash \operatorname{do} 5(\mathrm{p})(\mathrm{u})\}$
Definition 3 : The mapping
$\mathrm{A}_{\mathrm{p}}: \mathrm{L}^{\mathrm{p}}(\Omega) \rightarrow 2^{\mathrm{L}^{\mathrm{p}}(\Omega)}$ is m-accretive.
[Sorry. Ignored \begin\{proof\} ... \end\{proof\}] }
Then $\chi_{n}$ is monotone, Lipschitz with $\chi_{n}(0)=0$ and $\chi_{n}^{\prime}$ is continuous except at finitely many points on R. so $\left(\chi_{\mathrm{n}}\left(\mathrm{u}_{1}-\mathrm{u}_{2}\right), \partial \Phi_{\mathrm{p}}\left(\mathrm{u}_{1}\right)-\partial \Phi_{\mathrm{p}}\left(\mathrm{u}_{2}\right)\right) \geq 0$.
Then, for $u_{i} \in D\left(A_{p}\right)$ and $v_{i} \in A_{p} u_{i}, i=1,2, \quad$ we have

$$
\begin{array}{rlrl}
\left(v_{1}-v_{2}, J_{p}\left(u_{1}-u_{2}\right)\right) & = \\
\left(\left|u_{1}-u_{2}\right|^{p-1} \operatorname{sgn}^{2}\left(u_{1}-u_{2}\right), B_{p, q_{1}, q_{2}, \cdots, q_{m}} u_{1}-B_{p, q_{1}, q_{2}, \cdots, q_{m}}\right. & \left.u_{2}\right) & \\
& +\quad\left(\left|u_{1}-u_{2}\right|^{p-1} \operatorname{sgn}\left(u_{1}-u_{2}\right), \partial \Phi_{p}\left(u_{1}\right)-\partial \Phi_{p}\left(u_{2}\right)\right) \\
& = & \\
\left(\left|u_{1}-u_{2}\right|^{p-1} \operatorname{sgn}\left(u_{1}-u_{2}\right), B_{p, q_{1}, q_{2}, \cdots, q_{m}} u_{1}-B_{p, q_{1}, q_{2}, \cdots, q_{m}} u_{2}\right) & \\
& +\lim _{n \rightarrow \infty}\left(\chi_{n}\left(u_{1}-u_{2}\right), \partial \Phi_{p}\left(u_{1}\right)-\partial \Phi_{p}\left(u_{2}\right)\right) \geq o
\end{array}
$$

Step $2 R\left(1+\mu A_{p}\right)=L^{P}(\Omega)$, for every $\mu>0$.
We first define the mapping $\quad \mathrm{I}_{\mathrm{p}}: \mathrm{W}^{1, \mathrm{p}}(\Omega) \rightarrow\left(\mathrm{W}^{1, \mathrm{p}}(\Omega)\right)^{*}$ by $\quad \mathrm{I}_{\mathrm{p}} \mathrm{u}=\mathrm{u} \quad$ and $\left(\mathrm{v}, \mathrm{I}_{\mathrm{p}} \mathrm{u}\right)\left(\mathrm{W}^{1, \mathrm{p}_{( }}(\Omega)\right)^{*} \times \mathrm{W}^{1, \mathrm{p}}(\Omega)-(\mathrm{v}, \mathrm{u}) \mathrm{v}(\Omega) \quad$ for $\mathrm{u}, \mathrm{v} \in \mathrm{W}^{1, \mathrm{p}}(\Omega) \quad$, where $\langle\ldots,.\rangle{ }_{L}{ }_{2}(\Omega)$ denotes the inner product of $\mathrm{L}^{\mathrm{p}}(\Omega)$. Then $\mathrm{I}_{\mathrm{p}}$ is maximal monotone [7].
Secondly, for any $\mu>0$, let the mapping $\mathrm{T}_{\mu}: \mathrm{W}^{1, \mathrm{p}}(\Omega) \rightarrow 2\left(\mathrm{~W}^{1, \mathrm{p}}(\Omega)\right)^{*} \quad$ be defined by

$$
\mathrm{T} \mu \mathrm{u}=\mathrm{I}_{\mathrm{p}} \mathrm{u}^{\mathrm{+} \mu} \mathrm{~B}_{\mathrm{p}, \mathrm{q}_{1}, \mathrm{q}_{2}}, \cdots, \mathrm{q}_{\mathrm{m}} \mathrm{u}^{\mathrm{u} \partial \Phi_{\mathrm{p}}(\mathrm{u})}
$$

,for $\mathrm{u} \in \mathrm{W}^{1, \mathrm{p}}(\Omega)$. Then similar to that in [7], by lemmas $2.4,2.6,2.7$ and 2.5 we see that $\mathrm{T}_{\mu}$ is maximal monotone and coercive, so that $\mathrm{R}(\mathrm{T} \mu)=\left(\mathrm{W}^{1, \mathrm{p}}(\Omega)\right)^{*}$, for any $\mu>0$
Therefore, for any $f \in L^{P}(\Omega)$, there exists $u \in W^{1, p}(\Omega)$, such that

$$
\begin{equation*}
\mathrm{f}=\mathrm{T}_{\mu} \mathrm{u}^{\mathrm{u}+\mu \mathrm{B}_{\mathrm{p}, \mathrm{q}_{1}, \mathrm{q}_{2}}, \cdots, \mathrm{q}_{\mathrm{m}}}{\mathrm{u} \mu \partial \Phi_{\mathrm{p}}(\mathrm{u})}^{\text {( }} \tag{2}
\end{equation*}
$$

From the definition of $A_{p}$, it follows that $R\left(I+\mu A_{p}\right)=L^{p}(\Omega)$, for all $\mu>0$. This completes the proof.
Lemma 4 The mapping $A_{p}: L^{p}(\Omega) \rightarrow 2 L^{p}(\Omega)$, has a compact resolvent for $2 N /(N+1)<p<2$ and $N \geq 1$.
[Sorry. Ignored \begin\{proof\} ... \end\{proof\}] }
Remark 5 Since $\Phi_{p}(u+\alpha)=\Phi_{p}(u)$, for any $u \in W^{1, p}(\Omega)$ and $\alpha \in C_{0}^{\infty}(\Omega)$, we have $f \in A_{p} u$ implies that $f=B_{p, q_{1}, q_{2}}, \cdots, q_{m} \quad$ in the sense of distributions.
Proposition 6 For $f \in L^{p}(\Omega)$, if there exists $u \in L^{p}(\Omega)$ such that $f \in A_{p} u$, then $u$ is the unique solution of (1.7).
[Sorry. Ignored \begin\{proof\} ... \end\{proof\}] }
Remark 7 If $\beta_{x} \equiv 0$ for any $x \in \Gamma$ then $\partial \Phi_{p}(u) \equiv 0$, for all $u \in W^{1, p}(\Omega)$.

Proposition 8 If $\beta_{\mathrm{x}} \equiv 0$ for any $\mathrm{x} \in \Gamma$ then $\left\{\mathrm{f} \in \mathrm{L}^{\mathrm{P}}(\Omega) \mid \int \mathrm{fdx}=0\right\} \subset \mathrm{R}\left(\mathrm{A}_{\mathrm{p}}\right)$.
$\Omega$
[Sorry. Ignored \begin\{proof \} . . . \end\{proof\}] }
Definition 9 (see[1,7]). For $t \in R_{t}, x \in \Gamma$, let $\beta_{x}^{0}(t) \in \beta_{x}(t)$ be the element with least absolute value if $\beta_{x}(t) \neq 0$ and $\beta_{x}^{0}(t)= \pm \infty$, where $t>0$ or $t<0$ respectively, in case $\beta_{x}(t)=\varnothing$. Finally, let $\beta_{x}(t)={ }_{t \rightarrow \pm \infty} \beta_{x}^{0}(t)$ (in the extended sense) for $\mathrm{x} \in \Gamma \cdot \beta_{\mathrm{x}}(\mathrm{t})$ define measurable functions on $\Gamma$, in view of our assumptions on $\beta_{\mathrm{x}}$.
Proposition 10 Let $f \in L^{p}(\Omega)$ such that

$$
\int_{\Gamma} \beta_{-}(\mathrm{x}) \mathrm{d} \Gamma(\mathrm{x})<\int_{\Omega} \mathrm{fdx}<\int_{\Gamma} \beta_{+}(\mathrm{x}) \mathrm{d} \Gamma(\mathrm{x})
$$

Then $f \in \operatorname{Int} R\left(A_{p}\right)$.

$$
\text { [Sorry. Ignored \begin\{proof\} . . . \end\{proof\}] }}
$$

This completes the proof.
Proposition $11 A_{p}+B_{1}: L^{\mathrm{p}}(\Omega) \rightarrow \mathrm{L}^{\mathrm{p}}($ Omega $)$ is m-accretive and has a compact resolvent.

$$
\text { [Sorry. Ignored \begin\{proof\} . . . \end\{proof\}] }}
$$

Theorem: Let $\mathrm{f} \in \mathrm{L}^{\mathrm{p}}(\Omega)$ be such that

$$
\int_{\Gamma} \beta_{-}(x) d \Gamma(x)+\int_{\Omega}^{g_{-}}(x) d x<\int_{\Omega} f(x) d x \quad<\quad \int_{\Gamma} \beta_{+}(x) d \Gamma(x)+\int_{\Omega} g_{+}(x) d x
$$

then(1.4) has a unique solution in $L^{p}(\Omega)$, where $2 \mathrm{~N} /(\mathrm{N}+1)<\mathrm{p}<+\infty$ and $\mathrm{N} \geq 1$
[Sorry. Ignored \begin\{proof\} ... \end\{proof\}] }
Remark: Compared to the work done in [1-7], not only the existence of the solution of (1.4) is obtained but also the uniqueness of the solution is obtained. Furthermore, our work extended the work of [12]
