On the Existence and uniqueness for solution of system Fractional Differential Equations

Maha Abd Al-Wahab
Department of Applied Science University of Technology Baghdad- Iraq

Abstract: In this paper we extend theorem of existence and uniqueness of fractional differential equations to n system of fractional differential equations.

I. Introduction

Fractional differential equation is a generalization of ordinary differential equations and integrations to arbitrary non integer order. For the past three centuries this subject has been dealt with by mathematicians and in the last years this essential to understand the solution of many application in various fields of sciences like physics and engineering [1,2], chemistry and computer hard disc by control [3,4], also nuclear energy science [5,6] and dynamic systems [7].

II. Preliminaries

In this section, we introduce notation, definitions and preliminary facts which are used throughout this paper.

Definition (2-1) ([8]): Let \( A = \{F:F:[a,\infty) \times \mathbb{R}^n \rightarrow \mathbb{R} \text{ is continuous function} \} \) such that \( F(x,y) = (F_1(x,y), F_2(x,y), \ldots, F_n(x,y)) \), where \( y = (y_1, y_2, \ldots, y_n) \) is the transpose of \( F \). Let the norm \( ||y|| \) on \( A \) be defined by

\[
||F|| = \sup_{x \in [a,\infty)} \left\{ e^{-\gamma|x|} \right\} \left| F(y(x)) \right|
\]

provided that this norm exists for some \( \gamma > 0 \).

Definition (2.2) ([8]):

a- Let \( f \) be a lebesgue- measurable function define a-e on \( [a,b] \). If \( \alpha > 0 \) then we define

\[
I_{a}^{\alpha} f = \frac{1}{\Gamma(\alpha)} \int_{a}^{b} f(t)(b-t)^{\alpha-1} \, dt
\]

provided the integral (Lebesgue) exists.

b- If \( \alpha \in \mathbb{R} \), \( f \) is define a-e on \( [a,b] \), we define

\[
\frac{d^\alpha f}{dx^\alpha} = f^{(\alpha)}(x) = \int_{a}^{x} \frac{d^{\alpha-1} f}{d(x-t)^{\alpha-1}} \, dt
\]

for all \( x \in [a,b] \) provided that \( \int_{a}^{x} \frac{d^{\alpha-1} f}{d(x-t)^{\alpha-1}} \, dt \) exists.

Lemma (2.1)([9]): Let \( 0 < \alpha \leq 1 \) and \( f, g \) be a continuous function on \((a,\infty)\), where \( a \in \mathbb{R} \) and such that \( \sup\{||f(g(x))||: x \in (a,\infty)\} = M < \infty \). Define

\[
f_{\alpha}(x) = \frac{\mu(x-a)^{\alpha-1}}{\Gamma(\alpha)} + \frac{1}{\Gamma(\alpha)} \int_{a}^{x} (x-t)^{\alpha-1} f(g(t)) \, dt
\]

for all \( x > a \) and \( \mu \) is some constant. Then \( f_{\alpha} \in C(a,\infty) \).
Lemma (2.2) ([8]): Suppose that G is a banach space and let $T \in L(G)$ such that $\|T\|<1$. then $I-T$ is regular and $(I-T)^{-1} = I + \sum_{n=1}^{\infty} T^n$, where the series $\sum_{n=1}^{\infty} T^n$ converge in $L(G)$.

Lemma (2.3) ([9]): Let us define $F_a(x)=(x-a)^{1-a} f_a(x)$ on $(a,\infty)$, where $f_a$ defined in Lemma (2.1) and $0<\alpha \leq 1$. then $F_a \in C[a,\infty]$.

Lemma (2.4) ([8]): Let $\alpha, \gamma \in \mathbb{R}, \gamma>-1$. If $x>a$ then

$$
\int_a^x \frac{(x-t)^{\alpha} (t-a)^{\gamma}}{\Gamma(\alpha + \gamma + 1)} \, dt = \begin{cases} 
\frac{(x-a)^{\alpha+\gamma}}{\Gamma(\alpha + \gamma + 1)} & \text{, } \alpha + \gamma \neq \text{ negative integer} \\
0 & \text{, } \alpha + \gamma = \text{ negative integer}
\end{cases}
$$

Lemma (2.5) ([9]): If $0<\alpha \leq 1$ and $f(x)$ is continuous on $(a,b)$, $|f(x)| \leq M$ for all $x \in (a,b)$ (where $M \in \mathbb{R}^+$, $M>0$). Then

$$
\int_a^x \int_a^y f = f(x) \text{ for all } x \in (a,b).
$$

### III. Main Results

In this section we prove the existence and uniqueness solution of a system of fractional differential equations.

**Theorem (3):** Let $0<\alpha \leq 1$ and $\gamma$ be a positive constant. Let $g(x)^T = (g_1(x), g_2(x), \ldots, g_n(x))$, $x \in [a,\infty)$, where $g_i$ are continuous on $[a,\infty)$, $i=1, 2, \ldots, n$ and $|g(x)| = \left( \sum_{i=1}^{n} g_i^2 \right)^{\frac{1}{2}}$ and $|g(x)| \leq c + x \gamma$ \ldots (3.1)

where $c$ is a positive constant. Let $f = (f_1, f_2, \ldots, f_n)^T$ such that $f \in C[a,\infty)$ and $\text{Sup} \{|f(x)| : x \in [a,\infty)\} = M < \infty$. Choose $\lambda$ such that

$$
\lambda < \left( \frac{\epsilon}{\alpha} \right)^{-1}.
$$

Then there exists a continuous vector function $y(x)^T = (y_1(x), y_2(x), \ldots, y_n(x))^T$, $x \in (a,\infty)$ such that

$$
y^{(\alpha)}(x) = \lambda f(y(x)), \quad x \in (a,\infty) \quad \text{with } y^{(\alpha-1)}(a) = \mu, \quad \text{where } \mu = (\mu_1, \mu_2, \ldots, \mu_n)^T \text{ is some constant vector and satisfies } |y(x)| < \exp(\alpha x^{-1}|x|)-\text{constant}.
$$

**Proof**

Let $(A, \|\|)$ be the space defined in definition (2.1), $[a, a+h]$ be compact subinterval of $[a,\infty)$. Consider

$$
y(x) = y_0(x) + \frac{1}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} f(y(t)) \, dt, \quad x \in (a,\infty) \quad \ldots (3.2)
$$

where

$$
y_0(x) = \left( \frac{\mu_1 (x-a)^{\alpha-1}}{\Gamma(\alpha)}, \ldots, \frac{\mu_n (x-a)^{\alpha-1}}{\Gamma(\alpha)} \right)^T,
$$

if follows from Lemma (2.1) that $y \in (a,\infty)$.

Then

$$
(x-a)^{1-\alpha} y(x) = b + \frac{(x-a)^{1-\alpha}}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} f(y(t)) \, dt, \quad x \in (a,\infty),
$$

where

$$
b = \left( \frac{\mu_1}{\Gamma(\alpha)}, \frac{\mu_2}{\Gamma(\alpha)}, \ldots, \frac{\mu_n}{\Gamma(\alpha)} \right)^T.
$$

Let $F(x)^T = (x-a)^{1-a} y(x), \quad x \in (a,\infty) \ldots (3.3)$, where $y$ given in (3.2) and define $F(x, y(t)) = (x-a)^{1-a} f(y(t)), \quad a \leq t < \infty \ldots (3.4)$, then from Lemma (2.3) we have $F \in C(a,\infty)$.

Now define an operator $k$ on $A$ as
On the Existence and uniqueness for solution of system Fractional Differential Equations

\[
(kF)(x) = \frac{1}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} F(x, y(t))dt, \quad x \in [a, a+h] \quad \cdots (3.5)
\]

Then

\[
|kF(x)| = \frac{1}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} |F(x, y(t))|dt \leq \frac{1}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} e^{-\gamma|y(t)|} e^{\gamma|y(t)|} |F(x, y(t))|dt
\]

and so from definition (1.2), we have

\[
|kF(x)| \leq \frac{\|F\|}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} e^{\gamma|x|} dt
\]

Thus by using (3.1) we have

\[
|kF(x)| \leq \frac{\|F\| e^{\gamma x}}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} e^{\gamma|x|} dt \quad \cdots (3.6)
\]

Then from [10] we have

\[
\frac{1}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} e^{\gamma|x|} dt = \gamma^{-\alpha} e^{\gamma|x|} \quad \cdots (3.7)
\]

Then from (3.6) and (3.7) we have

\[
|kF(x)| \leq \frac{\|F\| e^{\gamma x}}{\Gamma(\alpha)} \gamma^{-\alpha} e^{\gamma|x|} \quad \cdots (3.8)
\]

Hence \(e^{-\gamma|x|}|kF(x)| \leq \|F\| e^{\gamma x} \gamma^{-\alpha}\) and so by definition (2.1) we get

\[
\|kF(x)\| \leq \|F\| e^{\gamma x} \gamma^{-\alpha} \quad \text{and hence}
\]

\[
\|k\| \leq \gamma^{-\alpha} e^{\gamma x} \quad \cdots (3.9)
\]

Now for \(|\lambda|<||k||^{-1}\) we obtain \(||\lambda k||=|\lambda|| \leq ||k||^{-1} ||k||=1\) and this implies that on using Lemma (2.2) \(\{I-\lambda k\}^{-1}\) exists. Also from (3.3) we have

\[
F(x) = b + \frac{\lambda}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} F(x, y(t))dt \quad \cdots (3.10)
\]

where \(b = \frac{\mu}{\Gamma(\alpha)}\)

Now (3.5) and (3.10) imply that

\(F(x)=b+\lambda kF(x)\), and so

\(F(I-k)=b\) and therefore

\(F(x)=\{I-\lambda k\}^{-1}(b)\) where \(I\) is the identity operator and hence \(F(x)\) exists and is the unique solution of

\[
F(x) = b + \frac{\lambda}{\Gamma(\alpha)} \int_a^x (x-t)^{\alpha-1} F(x, y(t))dt
\]

Now by simple calculation one can show that
On the Existence and uniqueness for solution of system Fractional Differential Equations

\[
\min_{\gamma} \gamma^{-\alpha} e^{\gamma c} = e^{\alpha \left( \frac{c}{\alpha} \right)^{\alpha}} \quad \text{where } \gamma c = \alpha.
\]

Since from (3.9), \(|k| < \frac{e^{\gamma c}}{\gamma c}\), there for

\[
|k| = \min_{\gamma} \left( \frac{e^{\gamma c}}{\gamma c} \right) = e^{\alpha \left( \frac{c}{\alpha} \right)^{\alpha}}
\]

Thus for

\[|\lambda| < \frac{1}{e^{\alpha \left( \frac{c}{\alpha} \right)^{\alpha}}} \quad \text{the solution } F \text{ of (3.10) exists and satisfies}
\]

\[F(x) = b + \lambda kF(x) \quad \text{...(3.11)}\]

Again from (3.3) we have

\[F(x) = b + \frac{\lambda}{\Gamma(\alpha)} \int_{a}^{x} (x-t)^{a-1} F(t, y(t)) dt \quad \text{for all } x \in (a, a+h]\]

and by using (3.3), it follows that

\[(x-a)^{1-\alpha} y(x) = \frac{\mu}{\Gamma(\alpha)} + \frac{\lambda}{\Gamma(\alpha)} \int_{a}^{x} (x-t)^{a-1} F(y(t)) dt \quad \text{for all } x \in (a, a+h]\]

\[y(x) = \frac{\mu(x-a)^{1-\alpha}}{\Gamma(\alpha)} + \frac{\lambda}{\Gamma(\alpha)} \int_{a}^{x} (x-t)^{a-1} F(y(t)) dt \]

Therefore by definition (2.2) (a) we get

\[y(x) = \frac{\mu(x-a)^{1-\alpha}}{\Gamma(\alpha)} + \lambda \int_{a}^{x} f \quad x \in (a, a+h] \quad \text{...(3.12)}\]

But from Lemma (2.4) we have \(\int_{a}^{x} (t-a)^{a-1} \frac{1}{\Gamma(\alpha)} = 0\) and by Lemma (2.5) we get

\[\int_{a}^{x} \int_{a}^{x} f = f(y(x)) \quad \text{for all } x \in (a, a+h]\]

Thus \(\int_{a}^{x} y = \lambda f(y(x)) \quad x \in (a, a+h]\)

Then using definition (2.2)(b) we get

\[y^{(\alpha)}(x) = \int_{a}^{x} -\alpha y = \lambda f(y(x)) \quad x \in (a, a+h]\]

Further more from (3.12) we have

\[\int_{a}^{x} (x-a)^{a-1} \frac{1}{\Gamma(\alpha)} + \frac{\lambda}{\Gamma(\alpha)} \int_{a}^{x} \int_{a}^{x} f \]

It follows from Lemma (2.4) that
On the Existence and uniqueness for solution of system Fractional Differential Equations

\[ I_a^{1-\alpha} y = \mu + \lambda I_a^{1-\alpha} f = \mu + \lambda \int_a^x f(y(t))dt \]

and so \[ I_a^{1-\alpha} y \] exists for all \( x \in (a, a+h] \)

since by definition (2.2)(b)

\[ y^{(\alpha-1)}(x) = I_a^{(1-\alpha)} y, \text{ therefore} \]

\[ y^{(\alpha-1)}(a) = \mu \]

Now from (3.11) we have \( |F(x)| \leq b + |\lambda|, |kF(x)| \) and from (3.8) get

\[ |F(x)| \leq b + |\lambda| \left| F \right| e^{r_c} e^{\gamma|x|} \]

< \( b + \left| F \right| e^{\gamma|x|} \) (since \( r_c = \alpha \))

= \( e^{\gamma|x|} (b e^{-\gamma|x|} + \left| F \right|) \)

< \( e^{\gamma|x|} (b + \left| F \right|) \)

Thus by using (3.3) we obtain

\[ \left| (x-a)^{1-\alpha} y(x) \right| < e^{\gamma|x|} \left[ b + \left| F \right| \right] \]

\[ h^{1-\alpha} \left| y(x) \right| < e^{\gamma|x|} \left[ b + \left| F \right| \right] \]

\[ \left| y(x) \right| < e^{\gamma|x|} h^{\alpha-1} \left[ b + \left| F \right| \right] \]

and so the solution function satisfies

\[ \left| y(x) \right| < \exp \left( xc^{-1}|x| \right) \cdot \text{constant} \]

IV. Conclusion

In this study we prove the existence and uniqueness of solution for system of fractional differential equations using (theorem (1)) and (theorem (2)) in [9]. The solution obtained can used to solve many problems in the mathematic and other sciences such as mechanics engineering, chemistry, physics, etc.
