Abstract: In this paper, we present Optimal Equi-scaled families of Jarratt method for computing zeros of system of nonlinear equations numerically. In this paper, we extending the idea of the proposed families of Jarratt method to system of nonlinear equations. It is proved that the above said families have second order of convergence. Numerical tests are performed, which conform theoretical results. Form the comparison with known methods it is observed that present method shows good stability and robustness.

Keywords: System of Nonlinear equations, Optimal Order of Convergence, Halley’s method, Schroder’s method, Jarratt method.

I. Introduction

Due to the fact that systems of nonlinear equations arise frequently in science and engineering they have attracted researcher’s interest. For example, nonlinear systems of equations, after the necessary processing step of implicit discretization, are solved by finding the solutions of systems of equations. We consider here the problem of finding a real zero, \( x^* = (x^*_1, x^*_2, \ldots, x^*_n)^T \), of a system of non linear equations

\[
\begin{align*}
  f_1(x_1, x_2, \ldots, x_n) &= 0; \\
  f_2(x_1, x_2, \ldots, x_n) &= 0; \\
  &\vdots \\
  f_n(x_1, x_2, \ldots, x_n) &= 0;
\end{align*}
\]

This system can referred in vector form by

\[
F(X) = 0 \quad (1.1)
\]

Where \( F = (f_1, f_2, \ldots, f_n)^T \) and \( X = (x_1, x_2, \ldots, x_n)^T \) (I.1)

Let the mapping \( F: \mathbb{D} \subset \mathbb{R}^n \rightarrow \mathbb{R}^n \) assumed to satisfy the assumptions (I.1). \( F(X) \) is continuously differentiable in an open neighborhood \( \mathbb{D} \) of \( X^* \).

There exists a solution vector \( X^* \) of (1.1) in \( \mathbb{D} \) such that \( F(X^*) = 0 \) and \( F'(X^*) \neq 0 \). Then the standard method for finding the solution to equation (1.1) is the classical Newton's method \([2-5]\) given by

\[
x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}, \quad k = 0, 1, 2, \ldots
\]

II. Construction Of Novel Techniques Without Memory

Case I: New optimal families of Jarratt’s method. The well-known Schroder’s method \([9]\) for multiple zero and Halley’s method \([6]\) for simple zero, are given by

\[
x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} (II.1)
\]

and

\[
x_{n+1} = x_n - \frac{2f(x_n)}{f''(x_n)} (II.2)
\]

respectivey.

We now intend to develop new optimal families of Jarratt’s method the having the quadratic scaling factor of function in the correction factor. For this, we take the arithmetic mean of (II.1) and (II.2) to get

\[
x_{n+1} = x_n - \frac{1}{2} \left( \frac{f(x_n)}{f'(x_n)} + \frac{2f(x_n)}{f''(x_n)} \right) (II.3)
\]

Now consider a Newton-type iterative method

\[
y_n = x_n - a f(x_n)/f'(x_n) \quad (II.4)
\]

where \( a \neq 0 \) CR

Now expanding the function \( f(y_n) \equiv f(x_n - a f(x_n)/f'(x_n)) \) about the point \( x = x_n \) by Taylor’s series expansion, we have

\[
f(y_n) = f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
f(y_n) = f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
f(y_n) = f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
= f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
= f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
= f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
= f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
= f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[
= f(x_n) - f'(x_n) a f(x_n)/f'(x_n) + \frac{1}{2} f''(x_n) a^2 f(x_n)/f'(x_n)^2
\]

\[
+ \frac{1}{3} f'''(x_n) a^3 f(x_n)/f'(x_n)^3 + \cdots
\]

\[ f'(x_n) \equiv \frac{af(x_n)}{f'(x_n)} \]

therefore, we obtain

\[ f'(x_n) \equiv \frac{f'(x_n)[f'(x_n) - f'(y_n)]}{a f(x_n)} \] (II.5)

Using the value of \( f'(x_n) \) from (II.5) in the equation (II.3), we get

\[
\begin{align*}
y_n &= x_n - a \frac{f(x_n)}{f'(x_n)} \\
x_{n+1} &= x_n - \frac{a}{2} \left( \frac{f(x_n)}{(a-1)f'(x_n) + f'(y_n)} + \frac{2f(y_n)}{(2a-1)f'(x_n) + f'(y_n)} \right)
\end{align*}
\] (II.6)

This method has quadratic convergence and satisfies the following error equation

\[ e_{n+1} = -\left( \frac{c_2^2}{2} e_n + \frac{1}{4} (6c_2^2 + (9a - 10)c) e_n + O(e_n^4) \right) \]

Again according to the Kung-Traub conjecture [7], the above method (II.6) is not an optimal method because it has second-order convergence and requires three evaluations of function per full iteration. Therefore, to build our optimal families of Jarrat’s method, we take five free disposable parameters. Therefore, we consider

\[
\begin{align*}
y_n &= x_n - a \frac{f(x_n)}{f'(x_n)} \\
x_{n+1} &= x_n - \frac{a}{2} \left( \frac{f(x_n)}{(a-1)f'(x_n) + f'(y_n)} + \frac{2f(y_n)}{(2a-1)f'(x_n) + f'(y_n)} \right)
\end{align*}
\] (II.7)

Where \( a, a_2, a_3, a_4, a_5 \) are disposable parameters such that the order of convergence reaches at the optimal level four without using any more functional evaluations. [10] Indicates that under what choice on the disposable parameters in (II.7), the order of convergence will reach at the optimal level four.

III. Convergence Analyses

We shall present the mathematical proof for the order of convergence of formula (II.10). Let \( D \subseteq R^n \rightarrow R^n \) be \( P \)-times Frechet differentiable in a convex set \( D \subseteq R^n \) then for any \( X, H \in R^n \), the following expression holds:

\[ F(X + H) = F(X) + F'(X)H + \frac{1}{2}F''(X)H^2 + \frac{1}{3!}F'''(X)H^3 + \ldots + \frac{1}{(p-1)!}F^{(p-1)}(X)H^{p-1} + R_p. \] (III.1)

Where \( ||R_p|| \leq 1/p! \sup ||Fp(X + th)|| ||H||^p \), \( 0 \leq t \leq 1 \)

and \( H_p = (h, h, \ldots, h, \ldots, h) \).

Now we analyze the behavior of (II.10) through the following theorem:

**Theorem 2.1.** Let \( D \subseteq R^n \rightarrow R^n \) be four times Frechet differentiable in a convex set \( D \) containing the root \( r \) of \( F(x) = 0 \). Then, the sequence \( x_k, k \leq 0 \) \( (x^0 \in D) \) obtained by using the iterative expression of method (1.2) converges to \( r \) with convergence order second if \( a_4 \neq 3a_5 \) or \( a_4 \neq -3a_5 \).

Proof: The Taylor’s expansion (3.1) for \( F(x) \) about \( x^r \) is

\[ F(x) = F(x^r) + F'(x^r)(x-x^r) + \frac{1}{2}! F''(x^r)(x-x^r)^2 + \frac{1}{3!} F'''(x^r)(x-x^r)^3 + \ldots + \frac{1}{(p-1)!} F^{(p-1)}(x^r)(x-x^r)^p + O(||x-x^r||^p). \] (III.2)

Let \( e^r = x^r - r \). Then, setting \( x = r \) and using \( F(r) = 0 \) in (III.2), we obtain
\[
F(x) = F(x) e^k - 1/2! F''(x) (e^k)^2 + 1/3! F'''(x) (e^k)^3 - 1/4! F^{(4)}(x) (e^k)^4 + O(||e||^5).
\]

(III.3)

Pre-multiplying by \(F'(x)^{-1}\) to both sides of (III.3)
\[
F'(x)^{-i} F(x) = e^k - 1/2! F'(x)^{-i} F''(x) (e^k)^2 + 1/3! F'(x)^{-i} F'''(x) (e^k)^3 - 1/4! F'(x)^{-i} F^{(4)}(x) (e^k)^4 + O(||e||^5).
\]

(III.4)

Now from (II.10), we yields
\[
y^k - x^k = -ek + 1/2! F'(x)^{-i} F''(x) (e^k)^2 - 1/6 F'(x)^{-i} F'''(x) (e^k)^3 + (||e||^k)^k.
\]

(III.5)

Also,
\[
y^k - x^k = (e^k)^2 - F'(x)^{-i} F''(x)^2 (e^k)^3 + (||e||^k)^k.
\]

(III.6)

\[
y^k - x^k = - (e^k)^3 + (||e||^k)^k.
\]

(III.7)

Here \(e^k = (e, c, \ldots, m, \ldots, e), e \in \mathbb{R}^m\).

Taylor's expansion of \(F(y^k)\) about \(x^k\) is,
\[
F(y^k) = F(x^k) + F'(x^k)(y^k-x^k) + 1/2! F''(x^k)(y^k-x^k)^2 + 1/3! F'''(x^k)(y^k-x^k)^3 + O(||y^k-x^k||^4).
\]

(III.9)

From (III.5)-(III.8) and (III.9), we obtain
\[
F(y^k) = F(x^k) + F'(x^k)(e^k)^2 + 1/3! F'''(x^k)(e^k)^3 + O(||e||^k)^k.
\]

(III.10)

Now from (II.10)
\[
e^{k+1} = e^k - 1/2 \left\{ \frac{(a_4^2 - 2 a_4 a_5 - 27 a_5^2) F'(x) + 3 (a_4^2 + 10 a_4 a_5 + 5 a_5^2) F(x)}{(a_4 F'(x) + 3 a_5 F(x)) \left( (3 a_4 + a_5) F'(x) - (a_4 + 5 a_5) F(x) \right)} \right\} F'(x)
\]

Let \(R(x^k) = [a_4^2 - 2 a_4 a_5 - 27 a_5^2] F'(x) + 3 (a_4^2 + 10 a_4 a_5 + 5 a_5^2) F(x)\)
and \(w(x^k) = (a_4 F'(x) + 3 a_5 F(x)) \left( (3 a_4 + a_5) F'(x) - (a_4 + 5 a_5) F(x) \right)\)
\[
R(x^k) = (a_4 F'(x) + 3 a_5 F(x)) (\text{e}^k)^2 - 2 [ (a_4 + 4 a_4 a_5 + 5 a_5) F'(x) F'''(x) (e^k)^2 + O(||e||^k)^k] \]

(III.11)

\[
w(x^k) = (a_4 + 4 a_4 a_5 + 5 a_5) F'(x) F'''(x) (e^k)^2 + O(||e||^k)^k] \]

(III.12)

From (III.11) and (III.12), we obtain
\[
w(x^k) e^k - R(x^k) = - 2 [ (a_4 + 4 a_4 a_5 + 5 a_5) F'(x) F'''(x) (e^k)^2 + O(||e||^k)^k].
\]

(III.13)

From (II.10) and (III.13), we have
\[
w(x^k) e^{k+1} = w(x^k) e^k - R(x^k)
\]

(III.14)

From the above equation it is clear that (II.10) is second order convergence if \(a_4 \neq 3a_5\) or \(a_4 \neq -3a_5\).

Special cases of formula (II.10):

(a) For \(a_4 = 1\) and \(a_5 = 1/3\), family (II.10) read as:
\[
\begin{align*}
y_n &= x_n - \frac{2 f(x_n)}{f'(x_n)} \quad x_{n+1} = x_n + \frac{4 \left[ f(x_{n+1}) + 11 F(Y_n) \right]}{2 \left( f'(x_{n+1}) - 3 f'(Y_n) \right)}(F(x_n) + 3 f'(Y_n)) \quad F(x_n)
\end{align*}
\]

(III.15)

This is a new second order method and satisfies the following error equation
\[
w(x^k) e^{k+1} = 8 F''(x^k) F'(x^k) (e^k)^2 + O(||e||^k)^k.
\]

(b) For \(a_4 = 1\) and \(a_5 = 1\), family (II.10) read as:
\[
\begin{align*}
y_n &= x_n - \frac{2 f(x_n)}{f'(x_n)} \quad x_{n+1} = x_n + \frac{16 f(x_{n+1}) - f'(Y_n)}{f'(x_{n+1}) + 4 f'(Y_n)}(F(x_n) + 3 f'(Y_n)) \quad F(x_n)
\end{align*}
\]

(III.16)

www.iosrjournals.org 54 | Page
This is a new second-order method and satisfies the following error equation
\[ w(x^{k+1}) = -2 \left[ 4F'(x^k)F''(x^k) - 16F''(x^k)F'(x^k) \right] (e^k)^2 + O(||e^k||^3). \]
(c) For \( a_4 = -2 \) and \( a_5 = 1 \), family (II.10) read as:
\[
\begin{align*}
  y_n &= x_n - \frac{2f(x_n)}{3f'(x_n)} \\
  x_{n+1} &= x_n - \frac{16[f'(x_n) - F'(y_n)]}{\{F'(x_n) + 3F'(y_n)\} (3F'(x_n) - 4F'(y_n))}F(x_n)
\end{align*}
\]
This is a new second-order method and satisfies the following error equation
\[ w(x^{k+1}) = -2 \left[ 4F'(x^k)F''(x^k) - 16F''(x^k)F'(x^k) \right] (e^k)^2 + O(||e^k||^3). \]

IV. Numerical Results

In this section, we shall check the performance of the present formula JSB1(III:15), JSB2(III:16), and JSB3(III:17) the comparison is carried out with Newton’s method and with HM and CM [8]. A Mat lab program has been written to implement these methods. We use the following stopping criteria for computer programs:
1. \( \varepsilon = 10^{-10} \).
2. \( |F(x_n)| < \varepsilon \)

For every method, we analyze the number of iterations needed to converge to the required solution. The numerical results are reported in the Table 1.

We consider the following problems for a system of nonlinear equations.

Problem (a)
\[
\begin{align*}
  x_1^2 - 2x_1 - x_2 + 0.5 &= 0 \\
  x_1^2 + 4x_2^2 - 4 &= 0
\end{align*}
\]

Problem (b)
\[
\begin{align*}
  x_1^2 + x_2^2 - 1 &= 0 \\
  x_1^2 - x_2^2 + 0.5 &= 0
\end{align*}
\]

Problem (c)
\[
\begin{align*}
  x_1x_2 + x_1(x_2 + x_3) &= 0 \\
  x_1x_3 + x_1(x_1 + x_3) &= 0 \\
  x_2x_1 + x_1(x_2 + x_1) &= 0 \\
  x_1x_2 + x_1x_3 + x_1x_4 - 1 &= 0
\end{align*}
\]

Problem (d)
\[
\begin{align*}
  e^{x_1} + x_1x_2 - x_2 - 0.5 &= 0 \\
  \sin(x_1x_2) + x_1 + x_2 - 1 &= 0
\end{align*}
\]

Problem (e)
\[
\begin{align*}
  x_1^2 + 2x_2^2 - 3 &= 0 \\
  2x_1^2 + x_2^2 - 5 &= 0
\end{align*}
\]

Problem (f)
\[
\begin{align*}
  x_1 + e^{x_2} - \cos(x_2) &= 0 \\
  3x_1 - x_2 - \sin(x_2) &= 0
\end{align*}
\]

Problem (g)
\[
\begin{align*}
  x_1^2 + x_2^2 + x_3^2 - 9 &= 0 \\
  x_1x_2x_3 - 1 &= 0 \\
  x_1 + x_2 - x_3 &= 0
\end{align*}
\]

Solution (a)
\[
r = (1.9006767263670658, 0.31121856541929427)^T
\]
Solution (b)
\[
r = (0.5000000000000000, 0.8660254378443865)^T \\
s = (-0.5000000000000000, -0.8660254378443865)^T
\]
Solution (c)
\[
r = (0.57735026918962576, 0.57735026918962576, 0.57735026918962576, -0.2886751459481288)^T \\
s = (0.57735026918962576, 0.57735026918962576, 0.57735026918962576, -0.2886751459481288)^T
\]

Solution (d) \( r = (0, 1)^T \)
Solution (e) \( r = (1.4880338717125849, 0.75598306414370757)^T \)
Solution (f) \( r = (0, 0)^T \)
Solution (g) \( r = (2.22448288477843, 0.28388497407293814, 1.58370776128252723)^T \)
\( s = (0.28388497407293814, 2.22448288477843, 1.58370776128252723)^T \)

IV. Conclusions

The presented formula (III.15) (III.16) and (III.17) is simple to understand, easy to program and has the second order of convergence. We contribute to the development of iteration processes and propose of Jarratt’s method. We now obtain a wide general class of Jarratt’s methods which are without memory and have the same scaling factor of function as that Jarratt’s method. Numerical tests have been performed, which not only illustrate the method practically but also serve to check the validity of theoretical results we have derived. The performance is compared with Newton method, CM [8] and HM [8].
