Abstract: Let G be a graph of order n with no isolated vertex. Let \( \mathcal{C}(G, i) \) be the family of vertex covering sets in G with cardinality i and let \( c(G, i) = |\mathcal{C}(G, i)|. \) The polynomial \( C(G, x) = \sum_{i=\beta(G)}^{n} c(G, i)x^i \) is called the vertex cover polynomial of G. In this paper, we obtain some properties of the polynomial \( C(P_n^2, x) \) and its coefficients. Also, we derive the reduction formula to calculate the vertex covering polynomial of square of path.

Key word: Square of path, vertex covering set, vertex covering number, vertex covering polynomial.

I. Introduction:

Let \( G = (V,E) \) be a simple graph. For any vertex \( v \in V \), the open neighborhood of \( v \) is the set \( \mathcal{N}(v) = \{u \in V/ uv \in E\} \) and the closed neighbourhood of \( v \) is the set \( \mathcal{N}_v = \mathcal{N}(v) \cup \{v\} \). For a set \( S \subseteq V \), the open neighborhood of \( S \) is \( \mathcal{N}(S) = \bigcup_{v \in S} \mathcal{N}(v) \) and the closed neighborhood of \( S \) is \( \mathcal{N}_S = \mathcal{N}(S) \cup S \).

A set \( S \subseteq V \) is a vertex covering of \( G \), if every edge \( uv \in E \) is adjacent to at least one vertex in \( S \). The vertex covering number, \( \beta(G) \), is the minimum cardinality of the minimum vertex covering sets in \( G \). A vertex covering set with cardinality \( \beta(G) \) is called a \( \beta \) -set.

We use \( \lfloor x \rfloor \), for the largest integer less than or equal to \( x \) and \( \lceil x \rceil \), for the smallest integer greater than or equal to \( x \).

Definition 1.1

The second power of a graph is a graph with the same set of vertices as \( G \) and it contains an edge between two vertices if and only if there is a path of length at most two between them. The second power of a graph is also called its square.

Let \( P_n^2 \) be the square of the path \( P_n \) (2nd power) with \( n \) vertices \( V(P_n^2) = \{1,2,3,\ldots,n\} \) and \( E(P_n^2) = \{(1,2), (2,3), \ldots, (n-1,n), (1,3), (2,4), \ldots, (n-2,n)\} \).

II. Vertex covering sets of square of the path

In this section we state the vertex covering number of the square of the path and some of its properties.

Definition 2.1

Let \( P_n^2 \) be the square of the path \( P_n \) with \( n \) vertices. Let \( \mathcal{C}(P_n^2, i) \) be the family of vertex covering sets of the graph \( P_n^2 \) with cardinality \( i \) and let \( c(P_n^2, i) = |\mathcal{C}(P_n^2, i)|. \) We call the polynomial \( C(P_n^2, x) = \sum_{i=\beta(P_n^2)}^{n} c(P_n^2, i)x^i \) as the vertex covering polynomial of the graph \( P_n^2 \).

Lemma 2.2

Let \( P_n^2 \) be the square of the path \( P_n \) with \( n \) vertices, then its vertex covering number is \( \beta(P_n^2) = \lceil \frac{2n}{3} \rceil \).

Lemma 2.3

Let \( P_n^2 \), \( n \geq 3 \) be the square of the path with \( n \) vertices, then \( c(P_n^2, i) = 0 \) if \( i < \lceil \frac{2n}{3} \rceil \) or \( i > n \) and \( c(P_n^2, i) > 0 \) if \( \frac{2n}{3} \leq i \leq n \).

Proof

If \( i < \lceil \frac{2n}{3} \rceil \) or \( i > n \), then there is no vertex covering set of cardinality \( i \). Therefore \( C(P_n^2, i) = 0 \).
By Lemma 2.2, the cardinality of the minimum vertex covering set is \( \frac{2n}{3} \). Therefore, \( c(P_n^2, i) > 0 \) if \( i \geq \frac{2n}{3} \) and \( i \leq n \). Hence, we have \( c(P_n^2, i) = 0 \) if \( i < \frac{2n}{3} \) or \( i > n \), and \( c(P_n^2, i) > 0 \) if \( \frac{2n}{3} \leq i \leq n \).

**Lemma 2.4**

Let \( P_n^2 \), \( n \geq 2 \) be the square of the path with \( n \) vertices. Then

(i) If \( C(P_{n-1}^2, i-1) = \phi \) and \( C(P_{n-3}^2, i-2) = \phi \), then \( C(P_n^2, i) = \phi \).

(ii) If \( C(P_{n-1}^2, i-1) = C(P_{n-2}^2, i-1) = \phi \), then \( C(P_n^2, i) = \phi \).

(iii) If \( C(P_{n-1}^2, i-1) = \phi \) and \( C(P_{n-3}^2, i-2) \neq \phi \), then \( C(P_n^2, i) \neq \phi \).

**Proof**

(i) By hypothesis, \( i-1 < \frac{2(n-1)}{3} \) or \( i-1 > n-1 \) and \( i-2 < \frac{2(n-3)}{3} \) or \( i-2 > n-3 \). Therefore, \( i-1 < \frac{2n-2}{3} \) or \( i-1 > n-1 \) and \( i-1 < \frac{2n-2}{3} \) or \( i-1 > n-2 \). Therefore, \( i < \frac{2n}{3} \) or \( i > n \). Hence \( C(P_n^2, i) = \phi \).

(ii) By hypothesis, \( i-1 < \frac{2(n-1)}{3} \) or \( i-1 > n-1 \) and \( i-2 < \frac{2(n-2)}{3} \) or \( i-2 > n-2 \) and \( i-1 < \frac{2(n-3)}{3} \) or \( i-1 > n-3 \). Therefore, \( i-1 < \frac{2n-3}{3} \) or \( i-1 > n-1 \). Therefore, \( i < \frac{2n}{3} \) or \( i > n \). Therefore, \( C(P_n^2, i) = \phi \).

(iii) By hypothesis, \( i-1 < \frac{2n-2}{3} \) or \( i-1 > n-1 \) and \( i-1 < \frac{2n-4}{3} \) or \( i-1 > n-2 \). Therefore, \( i < \frac{2n-2}{3} \) or \( i > n \). Hence, \( i-1 < \frac{2n-2}{3} \). Therefore, \( i < \frac{2n}{3} \). Therefore, \( C(P_n^2, i) = \phi \).

Therefore, \( C(P_n^2, i) = \phi \).

**Theorem 2.5**

Let \( P_n^2 \), \( n \geq 2 \) be the square of the path \( P_n \) with \( n \) vertices. Suppose that \( C(P_n^2, i) \neq \phi \). Then we have

(i) \( C(P_{n-1}^2, i-1) \neq \phi \) and \( C(P_{n-2}^2, i-2) = \phi \) if and only if \( n = 3k-1 \) and \( i = 2k-1 \).

(ii) \( C(P_{n-2}^2, i-1) = C(P_{n-3}^2, i-2) = \phi \) and \( C(P_{n-1}^2, i-1) \neq \phi \) if and only if \( i = n \).

(iii) \( C(P_{n-1}^2, i-1) \neq \phi \), \( C(P_{n-2}^2, i-1) \neq \phi \) and \( C(P_{n-3}^2, i-1) = \phi \) if and only if \( i = n-1 \).

(iv) \( C(P_{n-1}^2, i-1) = \phi \), \( C(P_{n-2}^2, i-1) = \phi \), \( C(P_{n-3}^2, i-1) \neq \phi \) if and only if \( n = 3k+1 \) and \( i = 2k \) for some \( k \).

(v) \( C(P_{n-1}^2, i-1) \neq \phi \), \( C(P_{n-2}^2, i-1) \neq \phi \), and \( C(P_{n-3}^2, i-1) \neq \phi \) if and only if \( \frac{2(n-1)}{3} + 1 \leq i \leq n-2 \).

**Proof**

(i) Assume \( C(P_{n-1}^2, i-1) \neq \phi \) and \( C(P_{n-2}^2, i-2) = \phi \). Since \( C(P_{n-2}^2, i-2) = \phi \), we have \( i-2 > n-2 \) (or \( i-2 < \frac{2(n-2)}{3} \)). Suppose \( i-2 > n-2 \), then \( i > n \). Therefore, \( C(P_n^2, i) = \phi \), which is a contradiction.

If \( i-2 < \frac{2(n-2)}{3} \), then \( i < \frac{2n}{3} \) + 2 \quad (1)

Also, \( C(P_{n-1}^2, i-1) \neq \phi \). Therefore, \( \frac{2(n-1)}{3} \leq i-1 \leq n-1 \). That is \( \frac{2n}{3} \leq i-1 \leq n-1 \). Therefore, \( \frac{2n}{3} + 1 \leq i \leq n \) \quad (2)

From (1) and (2) we have \( \frac{2n}{3} + 1 \leq i < \frac{2n}{3} + 2 \) \quad (3).

If \( n \neq 3k-1 \), then from (3), we obtain an inequality of the form \( s \leq i < s \), which is not possible.

When \( n = 3k-1 \), (3) holds, and in this case we obtain \( i = 2k-1 \). Conversely, assume \( n = 3k-1 \) and \( i = 2k-1 \). Then \( 2n = 6k-2, 2n-4 = 6k-6 \) and \( \frac{2n-4}{3} = 2k-2 \). Therefore, \( \frac{2(n-2)}{3} = 2k-2 \) \quad (1)

Now \( i = 2k-1, i-2 = 2k-3, 2k-2 = \frac{2(n-2)}{3} \). Therefore, \( i-2 < \frac{2(n-2)}{3} \). Therefore, \( C(P_{n-2}^2, i-2) = \phi \). Also \( \frac{2(n-2)}{3} \leq 2k-2 \leq 3k-2 \). That is \( \frac{2(n-1)}{3} \leq i-1 \leq n-1 \).

Hence \( C(P_{n-1}^2, i-1) > 0 \) and hence, \( C(P_{n-1}^2, i-1) \neq \phi \).

(ii) Since \( C(P_{n-2}^2, i-1) = \phi \), \( C(P_{n-3}^2, i-2) \), we have \( i-1 > n-2 \) or
On the vertex covering sets and vertex cover polynomials of square of paths

Theorem 2.6

Conversely suppose $i - 1 < \left\lfloor \frac{2(n-3)}{3} \right\rfloor$. Then $C(P_{n-1}^2; i - 1) = \phi$, which is a contradiction.

Therefore, $i - 1 > n - 2$, that is $i > n - 1$ which implies that $i \geq n$.

Also, since $C(P_{n-1}^2; i) \neq \phi$ if $i \leq n$. Combining these we get $i = n$.

Conversely if $i = n$ then $C(P_{n-1}^2; i - 1) = \phi$.

Therefore, we obtain $s > n - 2$ or $i - 1 = \left\lfloor \frac{2(n-3)}{3} \right\rfloor$.

Since $C(P_{n-3}^2; i - 2) = \phi$, we have $\left\lfloor \frac{2(n-3)}{3} \right\rfloor < i - 1 < \frac{2(n-1)}{3}$.

Then $i - 1 < \frac{2n-2}{3}$. Therefore, $C(P_{n-1}^2; i - 1) = \phi$, which is a contradiction.

Therefore, $i - 1 > n - 2$, that is $i > n - 1$ which implies that $i \geq n$.

Also, since $C(P_{n-1}^2; i) \neq \phi$ if $i \leq n$. Combining these we get $i = n$.

Conversely if $i = n$ then $C(P_{n-1}^2; i - 1) = \phi$.

Therefore, we obtain $s > n - 2$ or $i - 1 = \left\lfloor \frac{2(n-3)}{3} \right\rfloor$.

Since $C(P_{n-3}^2; i - 2) = \phi$, we have $\left\lfloor \frac{2(n-3)}{3} \right\rfloor < i - 1 < \frac{2(n-1)}{3}$.

Then $i - 1 < \frac{2n-2}{3}$. Therefore, $C(P_{n-1}^2; i - 1) = \phi$, which is a contradiction.

Therefore, $i - 1 > n - 2$, that is $i > n - 1$ which implies that $i \geq n$.

Also, since $C(P_{n-1}^2; i) \neq \phi$ if $i \leq n$. Combining these we get $i = n$.

Conversely if $i = n$ then $C(P_{n-1}^2; i - 1) = \phi$.

Therefore, we obtain $s > n - 2$ or $i - 1 = \left\lfloor \frac{2(n-3)}{3} \right\rfloor$.

Since $C(P_{n-3}^2; i - 2) = \phi$, we have $\left\lfloor \frac{2(n-3)}{3} \right\rfloor < i - 1 < \frac{2(n-1)}{3}$.

Then $i - 1 < \frac{2n-2}{3}$. Therefore, $C(P_{n-1}^2; i - 1) = \phi$, which is a contradiction.

Therefore, $i - 1 > n - 2$, that is $i > n - 1$ which implies that $i \geq n$.

Also, since $C(P_{n-1}^2; i) \neq \phi$ if $i \leq n$. Combining these we get $i = n$.

Conversely if $i = n$ then $C(P_{n-1}^2; i - 1) = \phi$.

Therefore, we obtain $s > n - 2$ or $i - 1 = \left\lfloor \frac{2(n-3)}{3} \right\rfloor$.

Since $C(P_{n-3}^2; i - 2) = \phi$, we have $\left\lfloor \frac{2(n-3)}{3} \right\rfloor < i - 1 < \frac{2(n-1)}{3}$.

Then $i - 1 < \frac{2n-2}{3}$. Therefore, $C(P_{n-1}^2; i - 1) = \phi$, which is a contradiction.
On the vertex covering sets and vertex cover polynomials of square of paths

\( \mathcal{C}(P_n^2, i) = \{ X \cup \{n-1, n-2\} / X \in \mathcal{C}(P_{n-3}^2, i-2) \} \cup \{Y \cup \{n\}/Y \in \mathcal{C}(P_{n-1}^2, i-1) \} \)

**Proof**

(i) Since \( \mathcal{C}(P_{n-3}^2, i-2) = \emptyset \) and \( \mathcal{C}(P_{n-1}^2, i-1) \neq \emptyset \), by lemma 2.5 (ii) \( i = n \).

Therefore, \( \mathcal{C}(P_n^2, i) = \mathcal{C}(P_n^2, n) = \{1, 2, 3, \ldots, n\} \).

(ii) Let \( \mathcal{C}(P_{n-1}^2, i-1) = \emptyset \). Then \( X = X_1 \cup \{n-1, n\} / X_1 \in \mathcal{C}(P_{n-1}^2, i) \).

Therefore \( \{X \cup \{n-1, n\} / X \in \mathcal{C}(P_{n-3}^2, i-2) \} \subseteq \mathcal{C}(P_n^2, i) \).

Conversely, assume \( X \in \mathcal{C}(P_n^2, i) \). Then, \( X \) is a vertex covering set of \( P_n^2 \) with cardinality \( i \). Elements of \( \mathcal{C}(P_n^2, i) \) end with \( n-1, n \) or \( n-2 \). Suppose it ends with \( n-1, n \). Then \( X \{n\} \in \mathcal{C}(P_{n-1}^2, i-1) \), which is a contradiction.

Suppose it ends with \( n-2 \). Then \( X \{n\} \in \mathcal{C}(P_{n-1}^2, i-1) \), which is also a contradiction. Therefore, the only possibility is that it ends with \( n-1, n-2 \). Therefore, we can write \( X = X_1 \cup \{n-1, n\} \) where \( X_1 \in \mathcal{C}(P_{n-1}^2, i-2) \). This implies \( \mathcal{C}(P_n^2, i) \subseteq \{X \cup \{n-1, n\} / X \in \mathcal{C}(P_{n-3}^2, i-2) \} \). Therefore, \( \mathcal{C}(P_n^2, i) = \{X \cup \{n-1, n\} / X \in \mathcal{C}(P_{n-3}^2, i-2) \} \).

(iii) The construction of \( \mathcal{C}(P_n^2, i) \) from \( \mathcal{C}(P_{n-1}^2, i-1) \) and \( \mathcal{C}(P_{n-3}^2, i-2) \) is as follows. Let \( X \) be a vertex covering set of \( P_n^2 \) with cardinality \( i \). All the elements of \( \mathcal{C}(P_n^2, i) \) end with \( n-1, n \) or \( n-2 \). Now adjoin \( n \) and \( n-2 \) with \( X \). Then \( X \cup \{n, n-2\} \) is a vertex covering set of \( \mathcal{C}(P_n^2, i) \).

Now, let us consider \( \mathcal{C}(P_{n-1}^2, i-1) \). All the elements of \( \mathcal{C}(P_{n-1}^2, i-1) \) end with \( n-1 \) or \( n-2 \). Let \( Y \) be a vertex covering set of \( P_{n-1}^2 \) with cardinality \( i-1 \). Now adjoin \( \{n\} \) with \( Y \). Then \( Y \cup \{n\} \in \mathcal{C}(P_{n-1}^2, i-1) \). Therefore, \( \mathcal{C}(P_{n-1}^2, i) \subseteq \{X \cup \{n, n-2\} / \mathcal{X} \in \mathcal{C}(P_{n-1}^2, i-2) \} \cup \{Y \cup \{n\} / Y \in \mathcal{C}(P_{n-1}^2, i-1) \} \)

Conversely, let us assume \( \mathcal{C}(P_{n-1}^2, i-1) \neq \emptyset \) and \( \mathcal{C}(P_{n-3}^2, i-2) \neq \emptyset \).

Let \( X \in \mathcal{C}(P_{n-1}^2, i-2) \). Then \( n-3 \) or \( n-5 \) or \( n-4, n-5 \) is in \( X \).

If \( n-3 \), \( n-4 \), or \( n-5 \), \( n-5 \), \( n-5 \), \( n-5 \) is in \( X \), then \( X \cup \{n, n-2\} \in \mathcal{C}(P_n^2, i) \).

Let \( Y \in \mathcal{C}(P_{n-1}^2, i-1) \), then at least one vertex labeled \( n-1, n-3 \) or \( n-2, n-3 \) is in \( Y \).

If \( n-1, n-3 \) or \( n-2, n-3 \) \( \notin Y \), then \( Y \cup \{n\} \notin \mathcal{C}(P_n^2, i) \). Thus we have

\[ \mathcal{C}(P_n^2, i) = \{ X \cup \{n, n-2\} / X \in \mathcal{C}(P_{n-3}^2, i-2) \} \cup \{Y \cup \{n\} / Y \in \mathcal{C}(P_{n-1}^2, i-1) \} \]

Combining (1) and (2), we get

\[ \mathcal{C}(P_n^2, i) = \{ X \cup \{n, n-2\} / X \in \mathcal{C}(P_{n-3}^2, i-2) \} \}

Theorem 2.7

If \( \mathcal{C}(P_n^2, i) \) is the family of vertex covering sets of \( P_n^2 \) with cardinality \( i \), where \( i > \left\lfloor \frac{2n}{3} \right\rfloor \), then

\[ |\mathcal{C}(P_n^2, i)| = |\mathcal{C}(P_{n-1}^2, i-1)| + |\mathcal{C}(P_{n-3}^2, i-2)| \]

**Proof**

From theorem 2.6, we consider the following three cases where \( i > \left\lfloor \frac{2n}{3} \right\rfloor \).

(i) If \( \mathcal{C}(P_{n-1}^2, i-1) = \emptyset \) and \( \mathcal{C}(P_{n-3}^2, i-2) = \emptyset \). Then \( \mathcal{C}(P_n^2, i) = \emptyset \).

(ii) If \( \mathcal{C}(P_{n-1}^2, i-1) = \emptyset \) and \( \mathcal{C}(P_{n-3}^2, i-2) \neq \emptyset \). Then \( \mathcal{C}(P_n^2, i) = \{ X \cup \{n, n-2\} / X \in \mathcal{C}(P_{n-3}^2, i-2) \} \}

From the above construction, in each case, we obtain that

\[ |\mathcal{C}(P_n^2, i)| = |\mathcal{C}(P_{n-1}^2, i-1)| + |\mathcal{C}(P_{n-3}^2, i-2)| \]

### III. Vertex covering polynomial of \( P_n^2 \)

Let \( C(P_n^2, x) = \sum_{i=1}^{\left\lfloor \frac{2n}{3} \right\rfloor} C(P_n^2, i)x^i \) be the vertex covering polynomial of path \( P_n^2 \). In this section, we derive the expression for \( C(P_n^2, x) \).

**Theorem 3.1**

For every \( n \geq 4, C(P_n^2, x) = xC(P_{n-1}^2, x) + x^2C(P_{n-3}^2, x) \) with initial values \( C(P_1^2, x) = 0, C(P_2^2, x) = x, C(P_3^2, x) = 3x^2 + x^3 \).

**Proof**

We have \( C(P_n^2, i) = C(P_{n-1}^2, i-1) + C(P_{n-3}^2, i-2) \).

Therefore, \( C(P_n^2, i)x^i = C(P_{n-1}^2, i-1)x^i + C(P_{n-3}^2, i-2)x^i \).

\[ \sum \mathcal{C}(P_n^2, i)x^i = \sum \mathcal{C}(P_{n-1}^2, i-1)x^i + \sum \mathcal{C}(P_{n-3}^2, i-2)x^i \]
On the vertex covering sets and vertex cover polynomials of square of paths

\[ \sum c(P_n^2,i)x^i = x \sum c(P_{n-1},i-1)x^{i-1} + x^2 \sum c(P_{n-2},i-2)x^{i-2}. \]
\[ C(P_n^2,x) = x C(P_{n-1},x) + x^2 C(P_{n-3},x). \]

With initial values \( C(P_2^2,x) = x, \) \( C(P_3^2,x) = 3x^2 + x^3. \)

We obtain \( c(P_n^2,i) \) for \( 1 \leq n \leq 15 \) as shown in the table 1.

In the following theorem, we obtain some properties of \( c(P_n^2,i) \).

**Theorem 3.2**

The following properties hold for the coefficients of \( c(P_n^2, x) \):

I. \( c(P_n^2, n) = 1 \) for every \( n \in \mathbb{N} \).

II. \( c(P_n^2, n-1) = n \) for every \( n \in \mathbb{N} \).

III. \( c(P_n^2, n-2) = \frac{1}{2} [n^2 - 5n + 6] , n \geq 4. \)

IV. \( c(P_n^2, n-3) = (n-4)C_3 \), for every \( n \geq 7. \)

V. \( c(P_{3n+1}^2, 2n) = 1 \), for every \( n \in \mathbb{N} \).

VI. \( c(P_{2n+1}^2, 2n+1) = n+1 \), for \( n \geq 2 \).

VII. \( c(P_{3n+2}^2, 2n+1) = n+2 \), for every \( n \in \mathbb{N} \).

**Proof**

(i) Since for any graph with \( n \) vertices \( C(G, n) = 1 \), we have \( c(P_n^2, n) = 1 \).

(ii) Since \( C(P_n^2, n-1) = \{[n]-\{x\} / x \in [n]\} \), we have \( c(P_n^2, n-1) = n \).

(iii) To prove \( c(P_n^2, n-2) = \frac{1}{2} [n^2 - 5n + 6] \).

We apply induction on \( n \). When \( n = 4 \),

L.H.S = \( c(P_4^2, n-2) = c(P_2^2, 4-2) = c(P_2^2, 2) = 1 \) (From the table)

and R.H.S = \( \frac{1}{2} [n^2 - 5n + 6] = \frac{1}{2} [16 - 20 + 6] = 1 \)

Therefore, the result is true for \( n = 4 \). Now suppose that the result is true for all numbers less than \( n \) and we prove it for \( n \). By theorem 3.1, we have

\[
C(P_n^2,x) = x C(P_{n-1},x) + x^2 C(P_{n-2},x) \]

We obtain \( c(P_n^2,i) \) for \( 1 \leq n \leq 15 \) as shown in the table 1.

(iv) To prove \( c(P_n^2, n-3) = (n-4)C_3 \) for \( n \geq 7 \).

We apply induction on \( n \). When \( n = 7 \),
On the vertex covering sets and vertex cover polynomials of square of paths

L.H.S = c(P^2_n, n-3) = c(P^2_(n-1), 7-3) = c(P^2_n, 4-2) = 1 (From the table) and
R.H.S = (n-4) C_3 = (n-4) 3C_3 = 1. Hence, the result is true for n=7. Now suppose that the result is true for all numbers less than ‘n’. Therefore, c(P^2_n,m-3) = (m-4) C_3, 7 \leq m \leq n-1.

Now to prove the result is true for n.

From Theorem 2.7, c(P^2_n,n-3) = (n^2-1)n-4) + c(P^2_n,n-3,n-5) = (n^2-5) C_3 + c(P^2_n,n-3,n-5)

\[= \binom{n^2-5}{n-4} \binom{n^2-4}{n-5} + c(P^2_n,n-3,n-5)\]

\[= \binom{n^2-5}{n-4} \binom{n^2-4}{n-5} + c(P^2_n,n-3,n-5)\]

Therefore, c(P^2_n,n-3) = (n-4) C_3. Therefore, the result is true for all n.

(vii) To prove c(P^2_{n+1},2n) = 1, for every n \in N. We apply induction on n.

Suppose n=1. c(P^2_{n+1},2n) = c(P^2, 2) = 1 (From the table). Assume the result true for all natures less than n. c(P^2_{n+1},2m+1) = 1 for all m less than n. Now we prove that the result is true for n.

\[c(P^2_{n+1},2n) = c(P^2_{n+2},2n-1) + c(P^2_{n+4},2n-2) + c(P^2_{n+6},2n-3) = c(P^2_{(n+1)+1},2(n-1)) + c(P^2_{(n+1)+4},2(n-1)) = \binom{n+1}{n-1} + \binom{n+1}{n-1-1}\]

Therefore, c(P^2_{n+1},2n) = 1 for all n \in N.

Now to prove c(P^2_{n+2},2m+1) = m+2, m \leq n. We apply induction on n.

Put n=1. L.H.S = c(P^2_{n+2},2n+1) = c(P^2_3,3) = 3 = 1+2+n+1 (R.H.S). Hence the result is true for all numbers less than n. c(P^2_{n+2},2n) = c(P^2_{n+2},2n-2) + c(P^2_{n+4},2n-3) + c(P^2_{n+6},2n-4) = c(P^2_{(n+1)+2},2(n-1)) + c(P^2_{(n+1)+4},2(n-1)) = \binom{n+2}{n-1} + \binom{n+2}{n-2}

Hence, the result is true for n. Therefore, c(P^2_{n+2},2n+1) = m+2, m \leq n.

IV. Conclusion

In this paper the vertex cover polynomial of square of path has been derived by identifying its vertex covering sets. It also helps us to characterize the vertex covering sets and to find the number of vertex covering sets of cardinality i. We can generalize this study to any power of the path and some interesting properties can be obtained via the roots of the vertex cover polynomial of P^k_n.
