# On The n-Dimensional Generalized Weyl Fractional Calculus Associated With n-Dimensional $\overline{\mathbf{H}}$-Transform 

V.B.L. Chaurasia ${ }^{1}$, Jagdish C. Arya ${ }^{2}$<br>${ }^{1}$ Department of Mathematics, University of Rajasthan,Jaipur, Rajasthan, India<br>${ }^{2}$ Department of Mathematics,Govt. Post Graduate College, Neemuch,,MP, India

#### Abstract

The main object of this paper is to obtain $n$-dimensional generalized Weyl fractional operators pertaining to multivariable H -function. Here we get the results by using n-dimensional Laplace and H transforms. The results of this paper are believed to be new and basic in nature. Some known results have been obtained by giving suitable values to the coefficients and parameters.

Key Words: Multivariable $\overline{\mathrm{H}}$-function, Weyl fractional operator, $\overline{\mathrm{H}}$-transform
Mathematics Subject Classification: 33C60, 33C65, 44-99

## I. Introduction

In this paper the n-dimensional Weyl fractional operator associated with $\overline{\mathrm{H}}$-transform is obtained. The results obtained in this paper are of manifold generality, basic in nature and include the results given earlier by Saigo, Saxena and Ram [15], Saxena and Ram [18], Chaurasia and Srivastava [3] etc.

The $\overline{\mathrm{H}}$-function appearing here, introduced by Inayat-Hussain ([7], see also [2]) in terms of MellinBarnes type contour integral, is defined as

$$
\overline{\mathrm{H}}_{\mathrm{P}, \mathrm{Q}}^{\mathrm{M}, \mathrm{~N}}\left[\mathrm{Z} \left\lvert\, \begin{array}{l}
\left(\mathrm{a}_{\mathrm{j}}, \alpha_{\mathrm{j}} ; \mathrm{A}_{\mathrm{j}}\right)_{1, \mathrm{~N}},\left(\mathrm{a}_{\mathrm{j}}, \alpha_{\mathrm{j}}\right)_{\mathrm{N}+1, \mathrm{P}}  \tag{1}\\
\left(\mathrm{~b}_{\mathrm{j}}, \beta_{\mathrm{j}}\right)_{1, \mathrm{M}},\left(\mathrm{~b}_{\mathrm{j}}, \beta_{j} ; \mathrm{B}_{\mathrm{j}}\right)_{\mathrm{M}+1, \mathrm{Q}}
\end{array}\right.\right]=\frac{1}{2 \pi \mathrm{i}} \int_{-\mathrm{i} \infty}^{\mathrm{i} \infty} \phi(\mathrm{~s}) \mathrm{Z}^{\mathrm{s}} \mathrm{ds}
$$

where

$$
\begin{equation*}
\phi(s)=\frac{\prod_{j=1}^{\mathrm{M}} \Gamma\left(\mathrm{~b}_{\mathrm{j}}-\beta_{\mathrm{j}} \mathrm{~s}\right) \prod_{\mathrm{j}=1}^{\mathrm{N}}\left\{\Gamma\left(1-\mathrm{a}_{\mathrm{j}}+\alpha_{\mathrm{j}} \mathrm{~s}\right)\right\}^{\mathrm{A}_{\mathrm{j}}}}{\prod_{\mathrm{j}=\mathrm{M}+1}^{\mathrm{Q}}\left\{\Gamma\left(1-\mathrm{b}_{\mathrm{j}}+\beta_{\mathrm{j}} \mathrm{~s}\right)\right\}^{\mathrm{B}_{\mathrm{j}}} \prod_{\mathrm{j}=\mathrm{N}+1}^{\mathrm{P}} \Gamma\left(\mathrm{a}_{\mathrm{j}}-\alpha_{\mathrm{j}} \mathrm{~s}\right)} \tag{2}
\end{equation*}
$$

which contains fractional powers of some of the $\Gamma$-functions. Here and throughout the paper $A_{j}$ $(j=1, \ldots, P)$ and $B_{j}(j=1, \ldots, Q)$ are complex parameters, $\alpha_{j} \geq 0(j=1, \ldots, P), \beta_{j} \geq 0(j=1, \ldots, Q)$ (not all zero simultaneously) and the exponents $A_{j}(j=1, \ldots, N)$ and $B_{j}(j=M+1, \ldots, Q)$ can take on non-integer values. The contour in (1) is imaginary axis $\operatorname{Re}(\mathrm{s})=0$. It is suitably indented in order to avoid the singularities of the $\Gamma$-functions and to keep these singularities on appropriate sides. Again, for $A_{j}(j=1, \ldots, N)$ not an integer, the poles of the $\Gamma$-functions of the numerator in (2) are converted to branch points. However, as long as there is no coincidence of poles from any $\Gamma\left(b_{j}-\beta_{j} s\right),(j=1, \ldots, M)$ and $\Gamma\left(1-a_{j}+\alpha_{j} s\right), \quad(j=1, \ldots, N)$ pair the branch cuts can be chosen so that the path of integration can be distorted in the usual manner. For the sake of brevity

$$
\begin{equation*}
\sigma=\sum_{j=1}^{M}\left|\beta_{j}\right|+\sum_{j=1}^{N} A_{j} \alpha_{j}-\sum_{j=M+1}^{Q}\left|B_{j} \beta_{j}\right|-\sum_{j=N+1}^{P} \alpha_{j}>0 \tag{3}
\end{equation*}
$$

Some useful generalization of both Riemann-Liouville and Erdelyi-Kober fractional integration operators are introduced by Saigo [11], [12] in terms of Gauss's hypergeometric function as given below.

Let $\alpha, \beta$ and $\theta$ are complex numbers and let $\mathrm{x} \in \mathrm{R}_{+}(0, \infty)$. Following [11], [12] the fractional integral $(\operatorname{Re}(\alpha)>0)$ and derivative $(\operatorname{Re}(\alpha)<0)$ of the first kind of a function $f(x)$ on $R_{+}$are defined respectively in the forms
(4)

$$
I_{0, x}^{\alpha, \beta, \theta} f=\frac{x^{-\alpha-\beta}}{\Gamma(\alpha)} \int_{0}^{x}(x-t)^{\alpha-1}{ }_{2} F_{1}\left(\alpha+\beta,-\theta ; \alpha ; 1-\frac{t}{x}\right) f(t) d t ; \operatorname{Re}(\alpha)>0
$$

$$
\begin{equation*}
=\frac{\mathrm{d}^{\mathrm{n}}}{\mathrm{dx}^{\mathrm{n}}} \mathrm{I}_{0, \mathrm{x}}^{\alpha+\mathrm{n}, \beta-\mathrm{n}, \theta-\mathrm{n}} \mathrm{f}, 0<\operatorname{Re}(\alpha)+\mathrm{n} \leq 1(\mathrm{n}=1,2, \ldots) \tag{5}
\end{equation*}
$$

where ${ }_{2} \mathrm{~F}_{1}(\mathrm{a}, \mathrm{b} ; \mathrm{c} ; \mathrm{x})$ is Gauss's hypergeometric function. The fractional integral $(\operatorname{Re}(\alpha)>0)$ and derivative $(\operatorname{Re}(\alpha)<0)$ of the second kind are given by
(6) $I_{x, \infty}^{\alpha, \beta, \theta} \mathrm{f}=\frac{1}{\Gamma(\alpha)} \int_{\mathrm{x}}^{\infty}(\mathrm{t}-\mathrm{x})^{\alpha-1} \mathrm{t}^{-\alpha-\beta}{ }_{2} \mathrm{~F}_{1}\left(\alpha+\beta,-\theta ; \alpha ; 1-\frac{\mathrm{x}}{\mathrm{t}}\right) \mathrm{f}(\mathrm{t}) \mathrm{dt}, \quad \operatorname{Re} \alpha>0$

$$
\begin{equation*}
=(-1)^{n} \frac{d^{n}}{d x^{n}} I_{x, \infty}^{\alpha+n, \beta-n, \theta} f, 0<\operatorname{Re}(\alpha)+n \leq 1(n=1,2, \ldots) \tag{7}
\end{equation*}
$$

Following Miller [10, p.82], we denote by $u_{1}$ the class of functions $f\left(x_{1}\right)$ on $R_{+}$which are infinitely differentiable with partial derivatives of any order behaving as $0\left(\left|x_{1}\right|^{-\xi_{1}}\right.$ when $x_{i} \rightarrow \infty$ for all $\xi_{1}$. Similarly by $u_{2}$, we denote the class of function $f\left(x_{1}, x_{2}\right)$ on $R_{+} \times R_{+}$, which are infinitely differential with partial derivatives of any order behaving as $O\left(\left|x_{1}\right|^{-\xi_{1}}\left|x_{2}\right|^{-\xi_{2}}\right)$ when $x_{i} \rightarrow \infty$ for all $\xi_{i}(i=1,2)$.

On the same pattern by $u_{n}$, we denote the class of function $f\left(x_{1}, x_{2}, \ldots, x_{n}\right)$ on $R_{+} \mathrm{X}_{\text {( } \mathrm{n} \text { times) }}^{\mathrm{R}_{+}} \mathrm{X} . . \mathrm{xR}{ }_{+}$, which are infinitely differentiable with partial derivatives of any order behaving as
$0\left(\prod_{i=1}^{n}\left|x_{i}\right|^{\xi_{i}}\right)$ when $x_{i} \rightarrow \infty$ for all $\xi_{i}(i=1,2, \ldots, n)$.
The $n$-dimensional operator of Weyl type fractional integration of orders $\operatorname{Re}\left(a_{i}\right)>0, i=1,2, \ldots, n$ is defined in class $u_{n}$ by
 $=\frac{\prod_{i=1}^{n}\left(p_{i}\right)}{\prod_{i=1}^{n} \Gamma\left(a_{i}\right)} \int_{p_{1}}^{b_{i}} \int_{p_{2}}^{\infty} \ldots \int_{p_{n}}^{\infty} \prod_{i=1}^{n}\left[\left(u_{i}-p_{i}\right)^{a_{i}-1} u_{i}^{-a_{i}-b_{i}}{ }_{2} F_{1}\left(a_{i}+b_{i},-c_{i} ; a_{i} ; 1-\frac{p_{i}}{u_{i}}\right)\right]$

$$
f\left(u_{1}, u_{2}, \ldots, u_{n}\right) d u_{1} d u_{2} \ldots d u_{n}
$$

where $b_{i}$ and $c_{i}(i=1,2, \ldots, n)$ are real numbers.
The n -dimensional Laplace transform $\mathrm{L}\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right)$ of a function $\mathrm{F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}\right) \in \mathrm{u}_{\mathrm{n}}$ is defined as

$$
\begin{aligned}
& \text { (9) } L\left(p_{1}, p_{2}, \ldots, p_{n}\right)=\sigma\left[F\left(x_{1}, x_{2}, \ldots, x_{n}\right) ; p_{1}, p_{2}, \ldots, p_{n}\right] \\
& =\int_{0}^{\infty} \int_{0}^{(n-\text { times })}
\end{aligned} \int_{0}^{\infty} e^{-\sum_{i=1}^{n}\left(p_{i} x_{i}\right)} f\left(x_{1}, x_{2}, \ldots, x_{n}\right) d x_{1} d x_{2} \ldots d x_{n} .
$$

where $\operatorname{Re}\left(\mathrm{p}_{\mathrm{i}}\right)>0, \mathrm{i}=1,2, \ldots, \mathrm{n}$.
Similarly, the Laplace transform of
$f\left[u_{1} \sqrt{x_{1}^{2}-\lambda_{1}^{2}} H\left(x_{1}-\lambda_{1}\right), u_{2} \sqrt{x_{2}^{2}-\lambda_{2}^{2}} H\left(x_{2}-\lambda_{2}\right), \ldots, u_{n} \sqrt{x_{n}^{2}-\lambda_{n}} H\left(x_{n}-\lambda_{n}\right)\right]$
is defined by the Laplace transform of $\mathrm{F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}\right)$ where
(10)

$$
\mathrm{F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}\right)=\mathrm{f}\left[\mathrm{u}_{1} \sqrt{\left(\mathrm{x}_{1}^{2}-\lambda_{1}^{2}\right)} \mathrm{H}\left(\mathrm{x}_{1}-\lambda_{1}\right), \mathrm{u}_{2} \sqrt{\left(\mathrm{x}_{2}^{2}-\lambda_{2}^{2}\right)} \mathrm{H}\left(\mathrm{x}_{2}-\lambda_{2}, \ldots\right.\right.
$$

$$
\left.u_{n} \sqrt{\left(x_{n}^{2}-\lambda_{n}^{2}\right)} H\left(x_{n}-\lambda_{n}\right)\right]
$$

$\mathrm{x}_{\mathrm{i}}>\lambda_{\mathrm{i}}>0, \mathrm{i}=1,2, \ldots, \mathrm{n}$
and $H(t)$ denotes Heaviside's unit step function.
The n -dimensional $\overline{\mathrm{H}}$-transform $\xi\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right)$ of a function $\mathrm{F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}\right)$ is defined as
where $\lambda_{\mathrm{i}}>0, \mathrm{k}_{\mathrm{i}}>0(\mathrm{i}=1,2, \ldots, \mathrm{n}) ; \xi\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right)$ exists and belongs to $\mathrm{u}_{\mathrm{n}}$.
Also

$$
\begin{equation*}
\left|\arg \left(p_{i}\right)^{k_{i}}\right|<\frac{1}{2} \sigma_{i} \pi, i=1,2, \ldots, n \tag{12}
\end{equation*}
$$

where
$\sigma_{i}=\sum_{j=1}^{M_{i}}\left|\beta_{j}\right|+\sum_{j=1}^{N_{i}} A_{j} \alpha_{j}-\sum_{j=M_{i}+1}^{Q_{i}}\left|B_{j} \beta_{j}\right|-\sum_{j=N_{i}+1}^{P_{i}} \alpha_{j}>0$, for $i=1,2, \ldots, n$.

## II. Main Results

In this section, following $n$-dimensional $\overline{\mathrm{H}}$-transform $\xi_{1}\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right) \quad$ of $\mathrm{F}\left(\mathrm{X}_{1}, \mathrm{X}_{2}, \ldots, \mathrm{X}_{\mathrm{n}}\right)$ is used and it is defined by
(13) $\xi_{1}\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right)=\overline{\mathrm{H}}{ }_{\mathrm{P}_{1}+2, \mathrm{Q}_{1}+2 ; \mathrm{P}_{2}+2, \mathrm{Q}_{2}+2 ; \ldots ; \mathrm{P}_{\mathrm{n}}+2, \mathrm{Q}_{\mathrm{n}}+2}^{\mathrm{M}_{1}+2, \mathrm{~N}_{1} ; \mathrm{M}_{2}+2, \mathrm{~N}_{2} ; \ldots ; \mathrm{M}_{\mathrm{n}}+2, \mathrm{~N}_{\mathrm{n}}}$

$$
\left[F\left(x_{1}, x_{2}, \ldots, x_{n}\right) ; \psi_{1}, \psi_{2}, \ldots, \psi_{n} ; p_{1}, p_{2}, \ldots, p_{n}\right]
$$

$$
\begin{aligned}
=\int_{\lambda_{1}}^{\infty} \int_{\lambda_{2}}^{\infty} \ldots \int_{\lambda_{n}}^{\infty} \prod_{i=1}^{n}\left\{( p _ { i } x _ { i } ) ^ { \psi _ { i } - 1 } \overline { H } _ { P _ { i } + 2 , Q _ { i } + 2 } ^ { M _ { i } + 2 , N _ { i } } \left[\left(p_{i} x_{i}\right)^{k_{i}} \left\lvert\, \begin{array}{l}
\left(\left\{a_{j}\right\}_{i},\left\{\alpha_{j}\right\}_{i} ;\left(A_{j}\right\}_{i}\right)_{1, N_{i}}, \\
\left(b_{i}-\psi_{i}+1, k_{i} ; 1\right),\left(c_{i}-\psi_{i}+1, k_{i} ; 1\right),
\end{array}\right.\right.\right. \\
\left.\left.\quad\left(\left\{a_{j}\right\}_{i},\left\{\alpha_{j}\right\}_{i}\right)_{N_{i}+1, P_{i},\left(1-\psi_{i}, k_{i} ; 1\right),\left(a_{i}+b_{i}+c_{i}-\psi_{i}+1, k_{i} ; 1\right)}\right]\right\} f\left(x_{1}, x_{2}, \ldots, x_{n}\right) d x_{1} d x_{2} \ldots d x_{n},
\end{aligned}
$$

where it is assumed that $\xi_{1}\left(p_{1}, p_{2}, \ldots, p_{n}\right)$ exists and belongs to $u_{n}$ as well as $k_{i}>0, i=1,2, \ldots, n$ and other conditions on the parameters, in which additional parameters $a_{i}, b_{i}$ and $c_{i}, i=1,2, \ldots, n$ included correspond to those in (8).

THEOREM 1 Let $\xi\left(p_{1}, p_{2}, \ldots, p_{n}\right)$ be given by definition (11), then for $\operatorname{Re}\left(a_{i}\right)>0, \lambda_{i}>0, k_{i}>0, i=$ $1,2, \ldots, \mathrm{n}$ there holds the formula

$$
\begin{align*}
& \xi\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right)=\overline{\mathrm{H}}_{\mathrm{P}_{1}, \mathrm{Q}_{1} ; \mathrm{P}_{2}, \mathrm{Q}_{2} ; \ldots ; \mathrm{P}_{\mathrm{n}}, \mathrm{Q}_{\mathrm{n}}}^{\mathrm{M}_{1}, \mathrm{~N}_{\mathrm{n}} ; \mathrm{M}_{2}, \mathrm{~N}_{2} ; \ldots ; \mathrm{M}_{\mathrm{n}}, \mathrm{~N}_{\mathrm{n}}}\left[\mathrm{~F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}\right) ; \psi_{1}, \psi_{2}, \ldots, \psi_{\mathrm{n}} ; \mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right]  \tag{11}\\
& =\int_{\lambda_{1}}^{\infty} \int_{\lambda_{2}}^{\infty} \ldots \int_{\lambda_{n}}^{\infty} \prod_{i=1}^{n}\left\{( p _ { i } x _ { i } ) ^ { \psi _ { i } - 1 } \overline { H } _ { P _ { i } , Q _ { i } } ^ { M _ { i } , N _ { i } } \left[\left(p_{i} x_{i}\right)^{k_{i}} \left\lvert\, \begin{array}{l}
\left(\left\{a_{j}\right\}_{i},\left\{\alpha_{j}\right\}_{i} ;\left\{A_{j}\right\}_{i}\right)_{1, N_{i}}, \\
\left(\left\{b_{j}\right\}_{i},\left\{\beta_{j}\right\}_{i}\right\}_{1, M_{i}},
\end{array}\right.\right.\right. \\
& \left.\left.\begin{array}{l}
\left(\left\{a_{j}\right\}_{i},\left\{\alpha_{j}\right\}_{i}\right)_{N_{i}+1, P_{i}} \\
\left(\left\{b_{j}\right\}_{i},\left\{\beta_{j}\right\}_{i} ;\left\{B_{j}\right\}_{i}\right)_{M_{i}+1, Q_{i}}
\end{array}\right]\right\} f\left(x_{1}, x_{2}, \ldots, x_{n}\right) d x_{1} d x_{2} \ldots \mathrm{dx}_{\mathrm{n}}
\end{align*}
$$

$$
J_{p_{1}, \infty}^{a_{1}, b_{1}, c_{1}} J_{p_{2}, \infty}^{a_{2}, b_{2}, c_{2}} \ldots J_{p_{n}, \infty}^{a_{n}, b_{n}, c_{n}}\left[\xi\left(p_{1}, p_{2}, \ldots, p_{n}\right)\right]=\xi_{1}\left(p_{1}, p_{2}, \ldots, p_{n}\right)
$$

provided that $\xi_{1}\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right)$ exists and belongs to $\mathrm{u}_{\mathrm{n}}$.
Proof Let $\operatorname{Re}\left(a_{i}\right)>0, i=1,2, \ldots, n$ then by using (8) and (11), we have
(14) $J_{p_{1}, \infty}^{a_{1}, b_{1}, c_{1}}{ }_{J}^{p_{2}, \infty}, \ldots{ }_{p_{n}, \infty}^{a_{2}, b_{2}, c_{2}}{ }^{a_{n}, b_{n}, c_{n}}\left[\xi\left(p_{1}, p_{2}, \ldots, p_{n}\right)\right]$

$$
=\frac{\prod_{i=1}^{n}\left(p_{i}\right)^{b_{i}}}{\prod_{i=1}^{n} \Gamma\left(a_{i}\right)} \int_{p_{1}}^{\infty} \int_{p_{2}}^{\infty} \ldots \int_{p_{n}}^{\infty} \prod_{i=1}^{n}\left[\left(u_{i}-p_{i}\right)^{a_{i}-1} u_{i}^{-a_{i}-b_{i}}{ }_{2} F_{1}\left(a_{i}+b_{i},-c_{i} ; a_{i} ; 1-\frac{p_{i}}{u_{i}}\right)\right]
$$

$\xi\left(u_{1}, u_{2}, \ldots, u_{n}\right) d u_{1} d u_{2} \ldots d u_{n}$
$=\frac{\prod_{i=1}^{n}\left(p_{i}\right)^{b_{i}}}{\prod_{i=1}^{n} \Gamma\left(a_{i}\right)} \int_{p_{1}}^{\infty} \int_{p_{2}}^{\infty} \ldots \int_{p_{n}}^{\infty} \prod_{i=1}^{n}\left[\left(u_{i}-p_{i}\right)^{a_{i}-1} u_{i}^{-a_{i}-b_{i}}{ }_{2} F_{1}\left(a_{i}+b_{i},-c_{i} ; a_{i} ; 1-\frac{p_{i}}{u_{i}}\right)\right]$

$$
\begin{aligned}
& {\left[\int _ { \lambda _ { 1 } } ^ { \infty } \int _ { \lambda _ { 2 } } ^ { \infty } \ldots \int _ { \lambda _ { n } } ^ { \infty } \prod _ { i = 1 } ^ { n } \left\{( u _ { i } x _ { i } ) ^ { \psi _ { i } - 1 } \overline { H } _ { P _ { i } , Q _ { i } } ^ { M _ { i } , N _ { i } } \left[\left(u_{i} x_{i}\right)^{k_{i}} \left\lvert\, \begin{array}{l}
\left(\left\{a_{j}\right\}_{i},\left\{\alpha_{j}\right\}_{i} ;\left(A_{j}\right\}_{i}\right)_{1, N_{i}}, \\
\left(\left\{b_{j}\right\}_{i},\left\{\beta_{j}\right\}_{i}\right)_{1, M_{i}},
\end{array}\right.\right.\right.\right.} \\

\left(\left\{a_{j}\right\}_{i},\left\{\alpha_{j}\right\}_{i} ;\left(A_{j}\right\}_{i}\right)_{1, N_{i}}, \\
\left(b_{i}-\psi_{i}+1, k_{i} ; 1\right),\left(c_{i}-\psi_{i}+1, k_{i} ; 1\right),
\end{array}\right.\right.\right. \\
& \left.\begin{array}{l}
\left(\left\{a_{j}\right\}_{i},\left\{\alpha_{j}\right\}_{i}\right)_{N_{i}+1, P_{i},\left(1-\psi_{i}, k_{i} ; 1\right),\left(a_{i}+b_{i}+c_{i}-\psi_{i}+1, k_{i} ; 1\right)} \\
\left(\left\{b_{j}\right\}_{i},\left\{\beta_{j}\right\}_{i}\right)_{1, M_{i}},\left(\left\{b_{j}\right\}_{i},\left\{\beta_{j}\right\}_{i} ;\left(B_{j}\right\}_{i}\right)_{M_{i}+1, Q_{i}}
\end{array}\right]\left\{f\left(x_{1}, x_{2}, \ldots, x_{n}\right) d x_{1} d x_{2} \ldots d x_{n}\right. \\
& =\bar{H}_{P_{1}+2, Q_{1}+2 ; P_{2}+2, Q_{2}+2 ; \ldots ; P_{n}+2, Q_{n}+2}^{M_{1}+2, N_{1} ; M_{2}+2, N_{2} ; \ldots ; M_{n}+2, N_{n}}\left[F_{1}\left(x_{1}, x_{2}, \ldots, x_{n}\right) ; \psi_{1}, \psi_{2}, \ldots, \psi_{n} ; p_{1}, p_{2}, \ldots, p_{n}\right] \\
& =\xi_{1}\left(\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}\right)
\end{aligned}
$$

As far as the $n$-dimensional Weyl type operators $J_{p_{1}, \infty}^{a_{1}, b_{1}, c_{1}}{ }_{J}^{{ }_{p}, \infty}{ }_{p_{2}, \infty}^{a_{2}, b_{2}, c_{2}} \ldots J_{p_{n}, \infty}^{a_{n}, b_{n}, c_{n}}$ preserves the class $u_{n}$, it follows that $\xi_{1}\left(p_{1}, p_{2}, \ldots, p_{n}\right)$ also belongs to $u_{n}$.

## III. Special Cases

(i) Setting $\mathrm{n}=3$ in result (13) the theorem 1 reduces to the result obtained by Chaurasia and Monika Jain [4, p.62].
(ii) By setting $\mathrm{n}=2$ and $\mathrm{n}=1$ in main result, we obtain two dimensional and one dimensional analogue respectively of theorem 1 given by Chaurasia and Monika Jain [4, p.66,67].
(iii) Taking $n=2, A_{j}=B_{j}=1$, the $\overline{\mathrm{H}}$-function in (1) converts to Fox's H-function and then (13) reduces to the result obtained by Saigo, Saxena and Ram [15, p.67].
(iv) Using $n=1, A_{j}=B_{j}=1$, (13) gives the result obtained by Saigo, Saxena and Ram [15, p.70].

## IV. Acknowledgement

The authors are grateful to Professor H.M. Srivastava, University of Victoria, Canada for his kind help and valuable suggestions in the preparation of this paper.
